Negative results and claim revision

Learn to understand, design, build, test and explain AI systems responsibly.

Project: Reproducible AI Research Study

THE CONNECTED WEEK

Report the unmet prediction and revise the claim honestly

Preserve negative results without turning a tie into equivalence or selected demonstrations into confirmation.

Keep one habit: Question and contract → complete main ledger → separate picture → boundary probes → investigation → independent attempt.

MAIN LESSON · SECTION 1

Report the unmet prediction and revise the claim honestly

> Preserve negative results without turning a tie into equivalence or selected demonstrations into confirmation.

Learning goals

I can explain the **mechanism** and terminology of **negative result**s and **claim revision**.

I can apply the stated procedure to a new case with a traceable result.

I can identify an assumption or limitation and design a revealing follow-up.

Retrieve before reading

Close your notes first. A rough first answer helps us choose the right starting point; it is not a score for your ability.

Without opening the old lesson, explain one key idea from Robustness across conditions. Give an example and a mistake that the idea helps you avoid.

Without opening the old lesson, explain one key idea from Running the primary experiment. Give an example and a mistake that the idea helps you avoid.

Without opening the old lesson, explain one key idea from Pilot experiments. Give an example and a mistake that the idea helps you avoid.

After trying, check the relevant lesson or ask your teacher. Change the part of your explanation that the **evidence** shows was wrong.

Starting explanation

- Recall Robustness across conditions. Explain why a recorded result needs its **input** conditions and **evidence** source before it can support a claim.

> **My starting explanation**

End goal

Explain **negative result**s and **claim revision** using the records and boundaries of this fictional investigation.

▼ Earlier wording, alternatives and picture transcripts

Your learning target

Remember before reading

This week you will practise:

Explain the **mechanism** and terminology of **negative result**s and **claim revision**

Apply the stated procedure to a new case with a traceable result

Identify an assumption or limitation and design a revealing follow-up

Retrieve what you already know

This week's end goal

MAIN LESSON · SECTION 2

Understand the question and evidence contract

> Preserve negative results without turning a tie into equivalence or selected demonstrations into confirmation.

Start with the research problem

A result is informative even when it does not meet the original expectation. Start with the criterion that was recorded before results, then state what the supplied evidence actually shows. An observed tie fails a strict-improvement prediction, but it does not prove equal population performance.

A useful next question can follow; label it new work rather than replacing the original hypothesis with one chosen to fit the outcome.

Original concept explanation

Negative results report that the **evidence** did not meet a declared expectation. They can reveal design limits or useful constraints without proving no effect anywhere.

Complete case inputs, rules and limits

Claim item	Complete supplied exercise contract
Main prediction	B support-pass count strictly above A on the reserved cases
Main supplied results	A and B each pass eight of ten
Decision about prediction	Strict observed improvement is not met
Separate picture	A and B each correct on six of eight; higher B was predicted
Later new task	Chosen because A fails; B wins on that selected task
Selection status	Post-result, favorable selection; not a replacement reserved evaluation
Unknown evidence	Paired case identities, uncertainty, equivalence margin, population equality and universal usefulness

Name given and missing evidence

List the given facts and one fact that is not supplied.

▼ **Earlier wording, alternatives and picture transcripts**

Begin by writing the question the procedure is intended to answer. Identify the information already supplied, the information it will produce and the information still missing.

These are constructed classroom examples; they do not require live accounts, private records or an external service. Do not treat a plausible explanation as a measured outcome.

MAIN LESSON · SECTION 3

Trace the complete main case before interpreting it

> Follow each evidence-to-conclusion step and retain unknown quantities.

Original declared procedure

Compare results with the original criterion and uncertainty assumptions. Preserve the failed hypothesis, discuss plausible **mechanism**s and label revised questions as new work.

Complete main-case evidence ledger

Main claim step	Complete result	Supported wording
A observed support passes	8/10 = 80%	Report supplied count and denominator
B observed support passes	8/10 = 80%	Same observed count
Observed difference	80% − 80% = 0 percentage points	Strict improvement not observed
Original expectation	B strictly above A	Expectation unmet on these cases
Population equality	Not tested or established	Do not say both methods are universally identical
Next question	Can be proposed with a new design	Preserve original result and identify new exploratory work

State the scope and explain the visual

Before applying the procedure, write its units, denominator or decision boundary where relevant. A partner should be able to repeat each step using the same **input**s.

If a required **input** is absent or violates the stated contract, record that condition explicitly instead of quietly replacing it with a convenient value.

Point to the **input**, the deciding step and the result in this week's visual. Explain the same step in ordinary words. A picture helps when you can say what each part represents.

▼ Earlier wording, alternatives and picture transcripts

Negative results and claim revision — evidence trace

INPUT AND SCOPE	CHECK OR CALCULATION	CONCLUSION AND LIMIT
Hypothesis expects B support strictly above A. Both pass 8/10 reserved cases.	Compare results with the original criterion and uncertainty assumptions. Preserve the failed hypothesis, discuss plausible mechanisms and label revised questions as new work.	Strict improvement is not observed; both 80%. This does not prove population equality or universal uselessness.

The figure connects this chapter's worked input, declared procedure and result. Read the complete worked reasoning for qualifiers and intermediate steps; the abbreviated labels do not replace that reasoning.

Connect the picture and the explanation

MAIN LESSON · SECTION 4

Predict the changed case before reading the explanation

> Keep the rule and evidence boundary visible.

Main task and response

- Hypothesis expects B support strictly above A. Both pass 8/10 reserved cases. Show the intermediate steps and give the conclusion with its scope.

> **Keep the procedure fixed. Explain what changed in the inputs and result.**

Predict the pictured change

- Change: B wins on one new task after the team chooses it because A fails.

▼ **Check after predicting**

Prediction: Treat that selected demonstration as exploratory, not a replacement for the original result.

Reason: Case selection now depends on outcomes.

▼ **Earlier wording, alternatives and picture transcripts**

Compare a familiar case with a changed case

Change one thing in the pictured case

MAIN LESSON · SECTION 6

Connect the main result with the separate pictured case

> Keep the two scenarios and their supplied evidence distinct.

Main case and original checked reasoning

Hypothesis expects B support strictly above A. Both pass 8/10 reserved cases.

Strict improvement is not observed; both **80%**. This does not prove population equality or universal uselessness.

Compare the intermediate **evidence** with the final statement. Explain why each number or decision follows from the stated **input**s.

The conclusion belongs to this scenario and procedure; changing the **input**s, evaluation population or authority can change what it establishes. Retain the raw record so a later revision can be compared honestly.

Separate pictured inputs and complete explanation

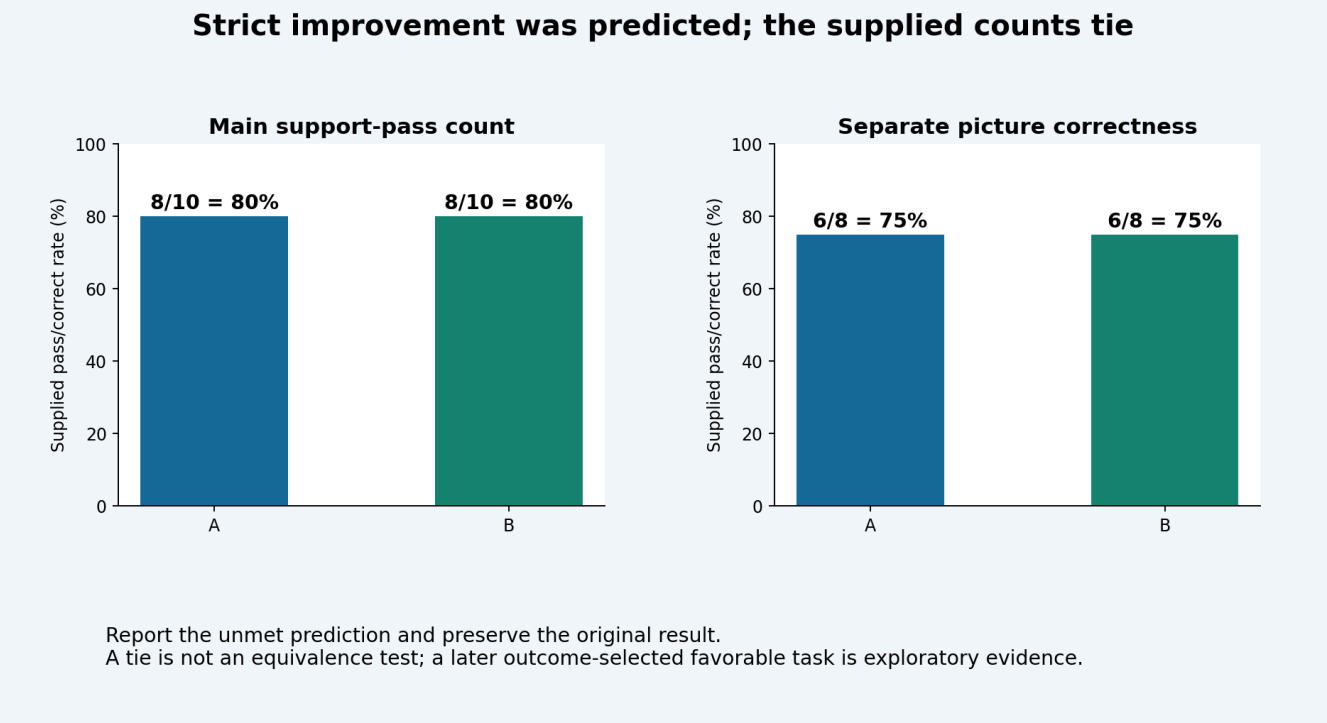

A **negative result** changes the claim. A proposed prompt improvement ties the baseline on a fixed eight-case evaluation.

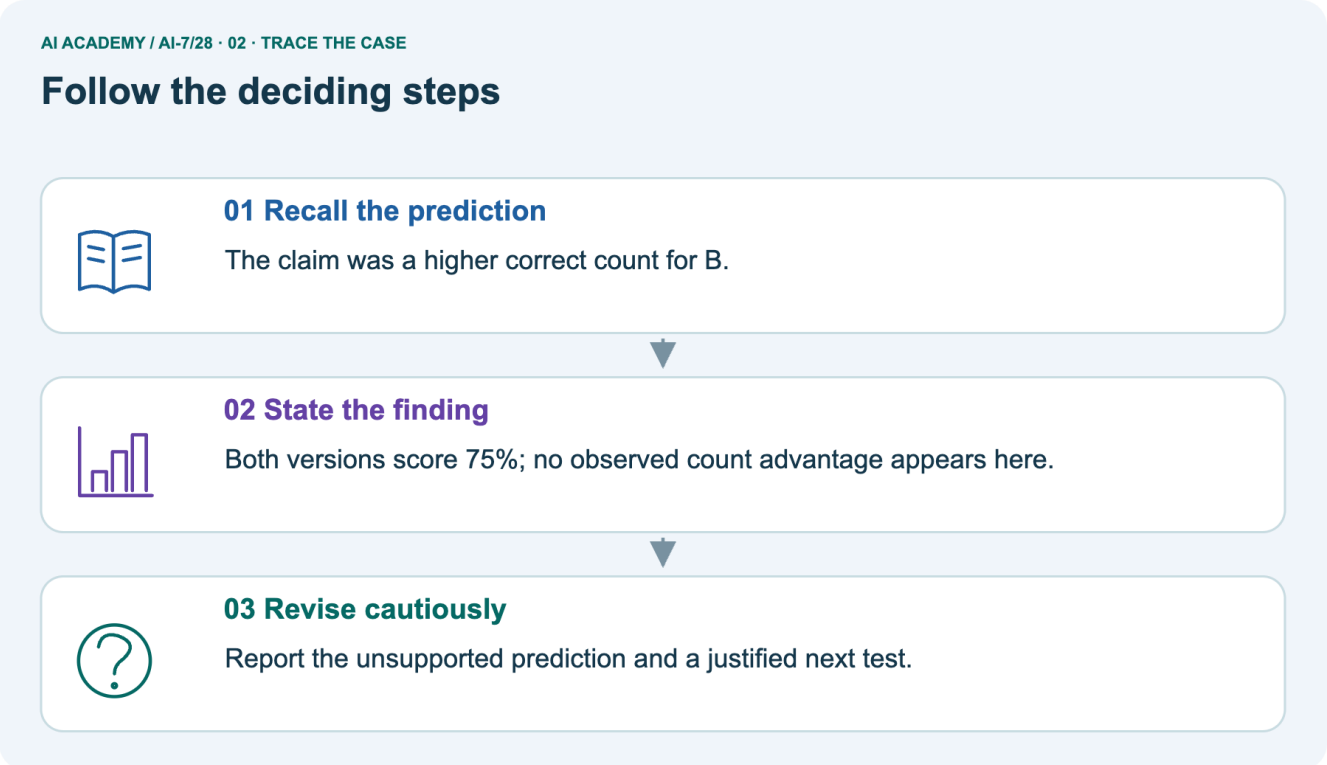

A and B each score 6/8. Before running, the team predicted B would score higher.

The separate eight-case picture gives A and B six correct each, or 75%. The observed difference is zero, so the prediction that B scores higher is not supported on this fixed set. The aggregate tie does not tell us whether the same cases were correct or whether failure patterns differ. It is not an equivalence test: uncertainty and a practical equivalence margin are unspecified.

A new task chosen because A fails can demonstrate that particular selected behavior if B wins, but outcome-driven selection prevents treating it as fresh representative confirmation. Keep the eight-case tie and selected demonstration as separate records.

Read the labelled representation

Follow the labelled picture with the matching explanation. Open the vector diagram

Read the picture one step at a time

STEP	WHAT HAPPENS AND WHY
1. Recall the prediction	The claim was a higher correct count for B.
2. State the finding	Both versions score 75%; no observed count advantage appears here.
3. Revise cautiously	Report the unsupported prediction and a justified next test.

Match each pictured step to the supplied facts. This is a worked teaching case, not an independent assessment.

A **negative result** can be informative when methods and limits are clear. A tie does not prove the methods are equivalent under all conditions or that the experiment was worthless.

Complete picture evidence and limits

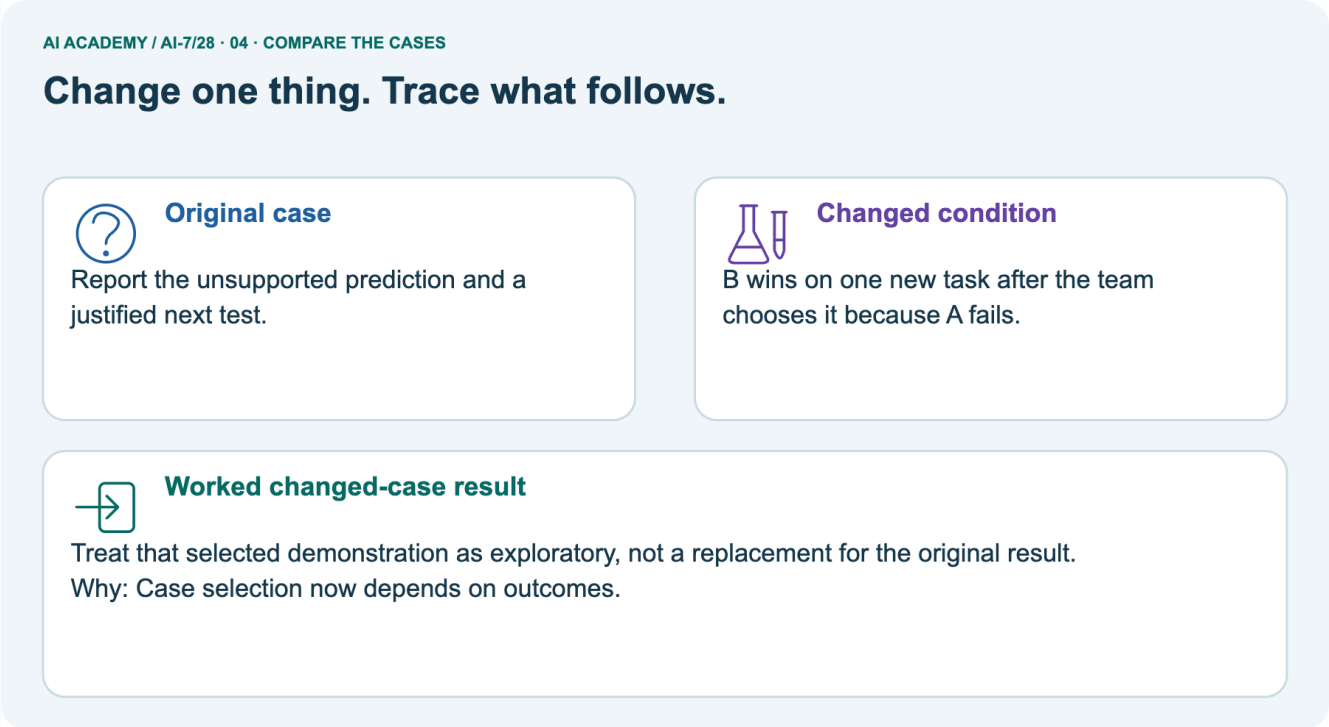

Separate picture evidence	Supported interpretation
A and B each 6/8	Both observed correctness rates 75%
Difference	Zero percentage points
Strictly higher B predicted	Not observed on this fixed set
Which cases differ	Unknown from the aggregate counts
Equivalence / population equality	Not established

Separate picture evidence	Supported interpretation
B wins on new task chosen because A fails	Selected demonstration; label exploratory
Original fixed-set result	Retained; not replaced by the favorable task

Predict the changed condition

- Change one thing: B wins on one new task after the team chooses it because A fails. Predict the result before checking the explanation. What remains the same?

▼ Check after predicting

Follow the labelled picture with the matching explanation. Open the vector diagram

Explain what remains unknown

- A tie on eight cases is not an **equivalence** test; uncertainty and practical thresholds remain unspecified.

- Read the labelled picture: Does a 6/8 tie support the **prediction** that B scores higher? Explain why one newly selected favourable demonstration does not replace the original result or prove **equivalence**.

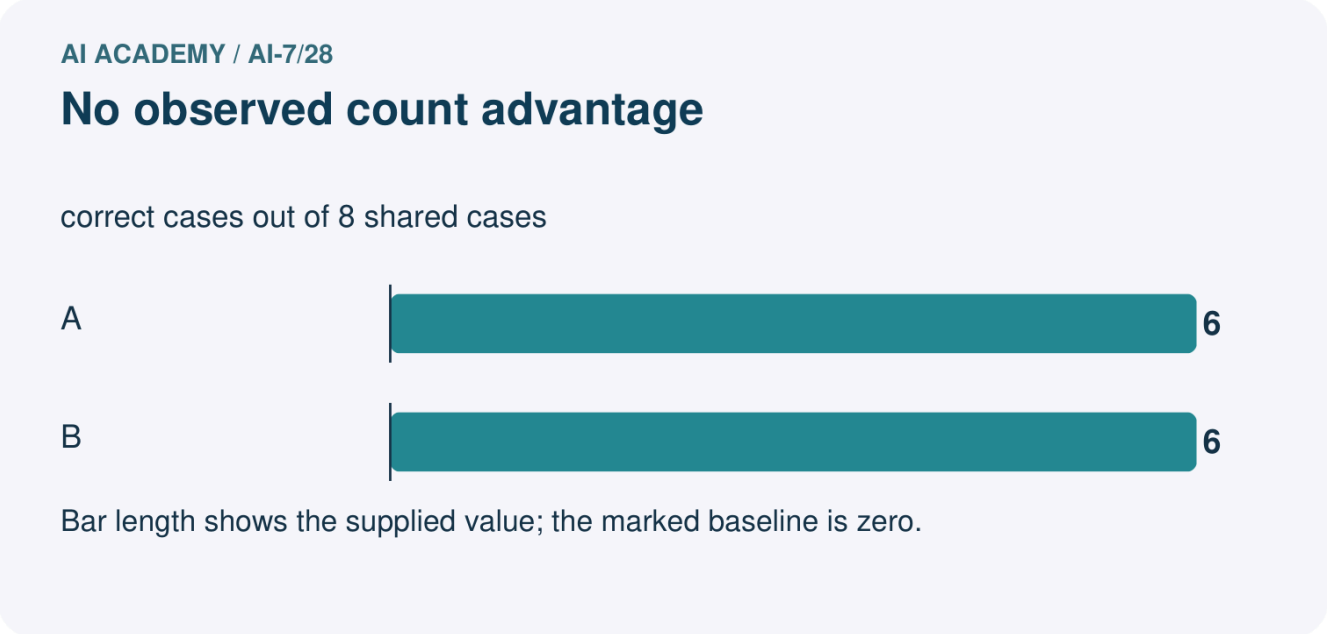

▼ Earlier wording, alternatives and picture transcripts

Learn from the worked case

Cover the result before checking it. Say what is given, choose the procedure, and follow one step at a time. Then uncover the result and explain your first mismatch. Ask why a step is allowed, not only what number it produces.

A pictorial worked case: Negative results and claim revision

The facts we will use

Follow the labelled picture with the matching explanation. Open the vector diagram

AI ACADEMY / AI-7/28

Negative results and claim revision

Start with the supplied facts

Follow each arrow. Ask which fact allows the next step.

1. Recall the prediction

The claim was a higher correct count for B.

2. State the finding

Both versions score 75%; no observed count advantage appears here.

3. Revise cautiously

Report the unsupported prediction and a justified next test.

CHANGE ONE THING

B wins on one new task after the team chooses it because A fails.

Explain the changed result using the matching lesson.

Follow the labelled picture with the matching explanation. Open the vector diagram

Why this result follows

What this example does not establish

Find the first unsupported inference and repair it

> Use the supplied conditions rather than inventing missing evidence.

Original qualification and repair setup

Failure to meet a criterion or reject a null is not proof of exact **equivalence**.

A useful check asks what would make the reasoning fail. Distinguish a failure to execute the declared procedure from a weakness in the procedure itself.

The first may require a correction; the second requires an explicitly revised method and new **evidence**. Preserve unsuccessful cases so an improved result cannot hide the original problem.

Complete boundary and misconception probes

Negative-result audit	Checked interpretation
Observed tie	Fails a strict-improvement criterion
Tie on eight or ten cases	Not proof of population equality
No benefit under this criterion	Not proof of uselessness everywhere
An explanation sounds plausible	Hypothesis for follow-up, not established cause
New task picked because baseline fails	Disclose selection; do not call it representative confirmation
A revised question looks promising	Label new work and preserve original hypothesis/result
Mean gain positive but below target	Report both magnitude and unmet criterion
Same totals	Not proof of identical per-case errors

Write and justify the repair

- A report omits this qualification: Failure to meet a criterion or reject a null is not proof of exact **equivalence**. Explain how omitting it could change a reader's interpretation, and write an accurate replacement.

Guided: restate the worked result, then name the assumption or limitation that prevents a broader conclusion.

State one repair and the checks you would rerun.

▼ Earlier wording, alternatives and picture transcripts

Locate the earliest unsupported step

MAIN LESSON · SECTION 8

Practise the mechanism with progressively less help

> Keep the selected independent case for a first attempt.

Shared explanation

- Explain the weekly **mechanism** in your own words. Use the worked scenario to name its **input**, decision rule and **output**.

Guided: restate the worked result, then name the assumption or limitation that prevents a broader conclusion.

Explain your prediction to a partner before comparing results.

Supported workbook trace

Use workbook W2 for the connected example "**Negative result**s and **claim revision**". First fill the **input** and rule boxes. Try the middle steps before asking for a hint. After a hint, try the next step yourself.

Plan	Do	Check
What is given? Which rule or procedure applies?	Record each intermediate step.	Does the result follow? What remains unknown?

Explain your trace to a partner. Your partner points to one step to check. Swap roles on the next case. Each person writes their own explanation.

Individual scope check

- Use the worked case for **Negative result**s and **claim revision**. Proposed explanation: “The worked result establishes every future case”. Decide whether this explanation is supported.

  Point to the step or supplied fact that decides; explain your repair if needed.

- Answer on your own before discussion. If you are unsure, say which step you need help with.

Picture response

- Does a 6/8 tie support the **prediction** that B scores higher? Explain why one newly selected favourable demonstration does not replace the original result or prove **equivalence**.

> **My explanation using a pictured step and the given facts**

Reserve the independent task

This is supported practice. Keep the separately named independent case for an attempt before feedback.

▼ **Earlier wording, alternatives and picture transcripts**

Practise with less help: Trace the worked case

Check your reasoning

Explain the picture

Investigate, record the evidence and check the limits

> Distinguish a prediction, a paper trace and an actual local execution.

Current investigation

Hypothesis expects B support strictly above A. Both pass 8/10 reserved cases. Show the intermediate steps and give the conclusion with its scope.

Complete investigation instructions

1. Perform a paper claim audit. Write the original strict-improvement criterion, both main eight-of-ten counts, zero observed difference and the limited conclusion that the criterion is unmet here. Separately inspect the picture's six-of-eight tie and selected favorable task. Keep the selected demonstration outside the original fixed-set record and mark proposed explanations or new evaluations as not run.

   Do not invent confidence bounds, equivalence thresholds or paired failures. Reserve the independent latency-gain criterion for a first attempt.

Evidence record and reflection

Record	Your evidence
Given input and fixed rule	
Prediction before checking	
Actual result, or "not run"	
First mismatch and one explanation	
Boundary or missing input and expected response	

On paper, trace the supplied procedure. If code is provided, predict before running it in a local practice file. Never write an expected answer as though it were an observed run.

Before trying: what do I expect, and why? While trying: which step could first go wrong? Afterwards: what did I actually observe, and what should change? Keep “not run” if you only traced the procedure.

▼ **Earlier wording, alternatives and picture transcripts**

Predict, investigate and preserve the evidence

Plan → try → check

MAIN LESSON · SECTION 14

Try the selected new case independently

> Compare the observed 0.8-second mean reduction with the declared at-least-two-second target and keep the conclusion scoped.

Complete independent task

Hypothesis predicts mean latency reduction at least 2 seconds. Observed paired mean reduction .8. Report.

First attempt and support record

My independent explanation, trace and limits

Attempt this case before feedback. Record any help. Earlier examples below are further practice; a case already practised with feedback cannot establish fresh transfer.

Feedback after trying

Attempt the independent case before hints. Record whether you worked alone, used a hint or followed a model. After feedback, fix the first unsupported step and explain why it changed.

A later check uses a changed case, not a copied answer.

▼ **Earlier wording, alternatives and picture transcripts**

Independent case: Apply a new case independently

Attempt this without hints

Hypothesis predicts mean latency reduction at least 2 seconds. Observed paired mean reduction .8. Report.

> **My independent procedure, result and limitation**
>
> | |
> |---|
> | |
> | |
> | |
> | |

Record support used: none, hint or teacher explanation. After feedback, a different case is needed to demonstrate independence.

Use feedback to improve

MAIN LESSON · SECTION 11

Save the research artifact and unresolved conditions

> Keep supplied evidence, proposed revisions and actual work distinct.

Project task and artifact

Add a labelled **negative result**s and **claim revision evidence** sheet to Reproducible AI Research Study. Show how you can explain the **mechanism** and terminology of **negative result**s and **claim revision**.

Use the supplied fictional case and keep its **input**s, intermediate steps, calculation or **prediction**, and limitation. Connect this record to last week's record; a matching answer without a trace is insufficient.

Project evidence	Record
Component and version	
Inputs permitted at prediction time	
Trace and comparison with earlier work	
Failure, limit and human review	

Evidence and limitations

For the Reproducible AI Research Study, retain an annotated worked trace and the changed-case reasoning. Connect the claim to its records, units and assumptions so another investigator can challenge or reproduce it.

▼ **Earlier wording, alternatives and picture transcripts**

Evidence for your project

MAIN LESSON · SECTION 16

Retrieve the mechanism and state the evidence boundary

> Explain what follows and what would require new evidence.

Retrieve and explain

- Close your notes. Explain this goal in your own words: Explain the **mechanism** and terminology of **negative result**s and **claim revision**

My deciding step, evidence and one remaining question

Plan a changed-case return

If you are unsure, return to the worked picture and explain one arrow. If you are ready, change an **input** or assumption and justify your **prediction**.

Save your workbook **evidence**. At the next review, try a different case before opening your old answer.

Reference bank and extra practice

Choose the reference that helps your next step.

▼ **Reference · Use research vocabulary precisely**

REFERENCE · SECTION 5

Reference · Use research vocabulary precisely

> Connect each term to the question, comparison, measurement or evidence.

Vocabulary and your explanation

Word	Meaning
Negative result	Evidence failing to meet the declared expectation
Claim revision	A bounded change to the conclusion
Equivalence	A separate claim requiring its own design and criterion

Use two terms to explain a step in this week's example.

▼ Extra challenge · Explain a stronger case

REFERENCE · SECTION 10

Extra challenge · Explain a stronger case

> Choose the next challenge after the main route.

Explain,repair and extend

- Explain the weekly **mechanism** in your own words. Use the worked scenario to name its **input**, decision rule and **output**.

- A report omits this qualification: Failure to meet a criterion or reject a null is not proof of exact **equivalence**. Explain how omitting it could change a reader's interpretation, and write an accurate replacement.

- For the worked scenario, propose one additional case that could reveal a failure, describe its expected outcome before running it, and explain what would need to remain fixed for a fair comparison.

  Do not reuse W4 as a new final test after receiving feedback.

Explain → apply → challenge

> **Explain which evidence supports your conclusion and which claim remains unproved.**

REFERENCE · SECTION 12

Reference · Check the research reasoning and its limits

> Use after practice; reserve the selected independent case for its first attempt.

Current explanation and response

- Complete the supported workbook tasks before attempting W4 independently. Record any hints or help used. After feedback, use the teacher's fresh retry rather than copying the earlier answer.

  For a project, select a relevant new case, predict the outcome from the declared rule and preserve the result alongside any revision.

- For the worked scenario, propose one additional case that could reveal a failure, describe its expected outcome before running it, and explain what would need to remain fixed for a fair comparison.

  Do not reuse W4 as a new final test after receiving feedback.

Exit: propose one revealing change to the worked scenario. State the expected outcome and the evidence that would make you revise your explanation.

My limited claim and a useful next check

▼ **Extra practice · Revisit the complete trace**

REFERENCE · SECTION 13

Extra practice · Revisit the complete trace

> Predict before reading the supplied steps.

Complete trace and evidence

Complete evidence record

Negative results and claim revision — evidence trace

INPUT AND SCOPE	CHECK OR CALCULATION	CONCLUSION AND LIMIT
Hypothesis expects B support strictly above A. Both pass 8/10 reserved cases.	Compare results with the original criterion and uncertainty assumptions. Preserve the failed hypothesis, discuss plausible mechanisms and label revised questions as new work.	Strict improvement is not observed; both 80%. This does not prove population equality or universal uselessness.

The figure connects this chapter's worked input, declared procedure and result. Read the complete worked reasoning for qualifiers and intermediate steps; the abbreviated labels do not replace that reasoning.

Follow the **input** through the stated procedure to its result. Cover the result first, predict it, then explain every intermediate step. The text/table accompanies the figure so the example can be read without colour.

My complete trace of the worked case

REFERENCE · SECTION 15

Reference · The earlier route checklist

> Use one main route rather than repeating the lesson.

Targets,route and first prediction

Start with this question: A **negative result** changes the claim. A proposed prompt improvement ties the baseline on a fixed eight-case evaluation.

By the end, I can	How I will show it
Explain the mechanism and terminology of negative results and claim revision	Explain the deciding step, show a trace or test, and state one limit.
Apply the stated procedure to a new case with a traceable result	Explain the deciding step, show a trace or test, and state one limit.
Identify an assumption or limitation and design a revealing follow-up	Explain the deciding step, show a trace or test, and state one limit.

Remember → watch and explain → try with help → investigate → try independently → keep project **evidence**. Your teacher may spread this lesson across several classes.

Keep your first **prediction**. Compare it with what the **evidence** shows and explain any change.

REFERENCE · SECTION 17

Extra practice · Predict,check and repair

> Keep supported feedback separate from the independent case.

First supported question and optional hint

- A **negative result** changes the claim. A proposed prompt improvement ties the baseline on a fixed eight-case evaluation.
- Which labelled step matches this detail? Report the unsupported **prediction** and a justified next test.
- 1. Revise cautiously
- 2. Recall the **prediction**
- 3. State the finding
- Hint if needed: Read the steps in the pictorial case. Match the supplied detail to the stage that performs or records it.

Practice 1: explain the deciding evidence

> **My selected conclusion, deciding fact and explanation**

▼ **Check after the first attempt**

After your attempt, compare with the supported explanation: Revise cautiously Report the unsupported **prediction** and a justified next test. A **negative result** can be informative when methods and limits are clear.

A tie does not prove the methods are equivalent under all conditions or that the experiment was worthless.

Changed-case question and optional hint

- Changed-case practice: B wins on one new task after the team chooses it because A fails. Which conclusion is supported by the supplied facts?
- 1. We can decide the result without examining the changed **input** or the procedure.
- 2. This one example guarantees correct results for every future **input**.
- 3. Treat that selected demonstration as exploratory, not a replacement for the original result.
- Hint if needed: Use the changed condition and the deciding step in the pictorial trace. The answer must say what follows from those facts.

Practice 2: explain the deciding evidence

> **My selected conclusion, deciding fact and explanation**

▼ **Check after the changed attempt**

After your attempt, compare with the supported explanation: Treat that selected demonstration as exploratory, not a replacement for the original result. Case selection now depends on outcomes.

Repair and retain the record

Review Robustness across conditions (ai-7/27). Goal: Explain the **mechanism** and terminology of robustness across conditions. Short practice: Calculate indoor, outdoor and combined rates.

Which relevant weakness disappears from view when only the combined rate is reported?. Return to this week and explain what you changed.

Review Running the primary experiment (ai-7/25). Goal: Explain the **mechanism** and terminology of running the primary experiment. Short practice: Compute A's and B's six-case counts and identify the cases that favour each.

How must a B revision tuned on case four be labelled when evaluated again on the same set?. Return to this week and explain what you changed.

Review Pilot experiments (ai-7/22). Goal: Explain the **mechanism** and terminology of pilot experiments. Short practice: Calculate reviewer agreement on the four pilot answers.

What can the disagreement improve, and why are those revised practice answers not untouched final **evidence**?. Return to this week and explain what you changed.

Use Download completed work in the hosted lesson to export your answers, reflections, practice feedback and code-run **evidence**. Open the HTML copy to read or print it.

Drafts stay in this browser when storage is available; clear drafts on a shared device.

▼ **Earlier wording, alternatives and picture transcripts**

Use this supported practice once, in the browser or on paper. Keep the reserved independent assessment for a separate first attempt before teacher feedback.

Repair a missing building block

Keep your completed work

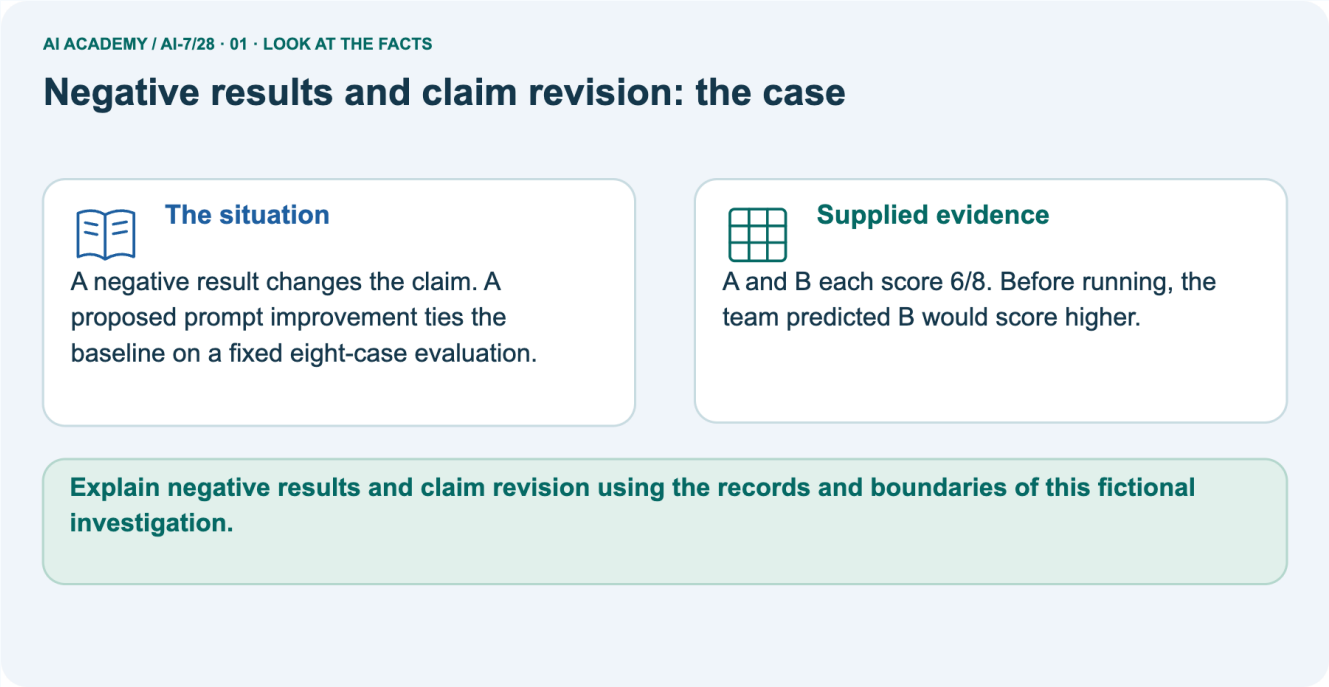

▼ **Reference · Six-picture concept journey**

REFERENCE · SECTION 18

Reference · Six-picture concept journey

> Choose the picture that supports the current explanation.

01. Negative results and claim revision: the case

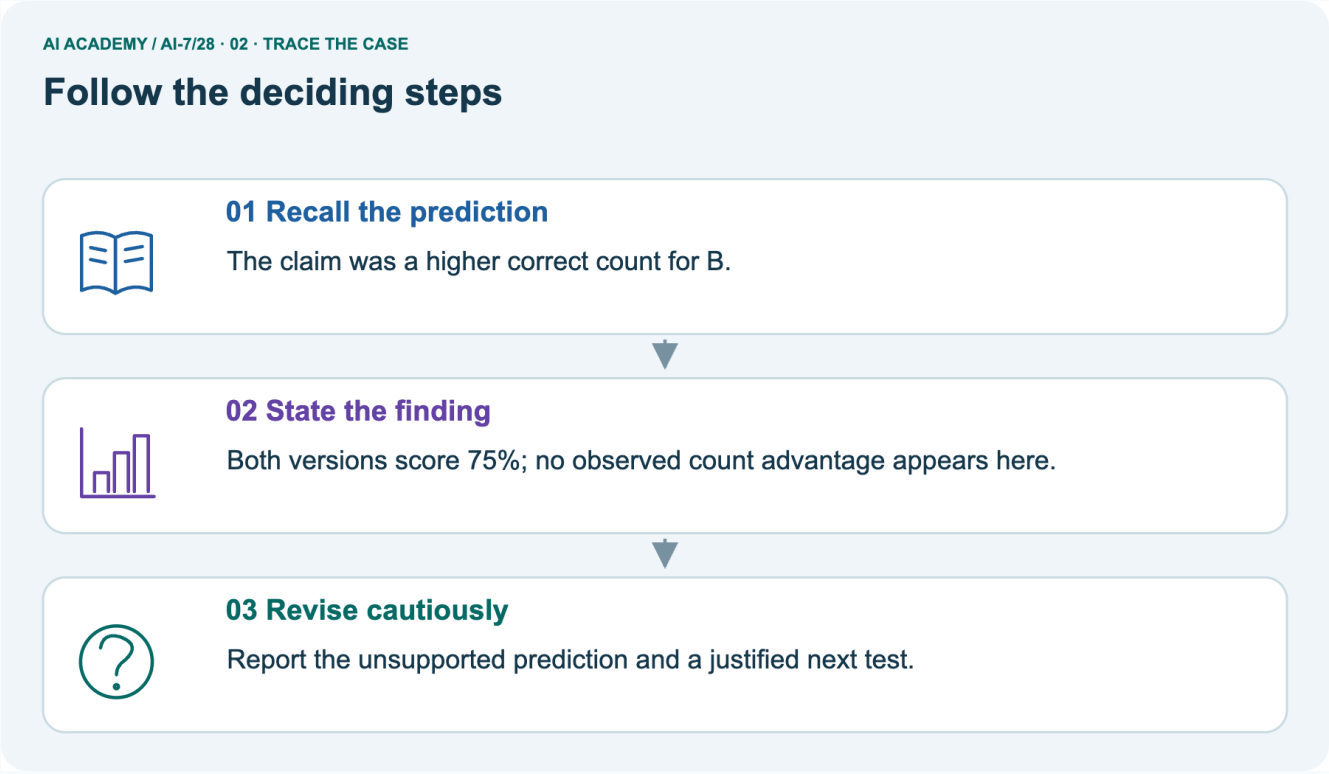

Follow the labelled picture with the matching explanation. Open the vector diagram

A **negative result** changes the claim. A proposed prompt improvement ties the baseline on a fixed eight-case evaluation. Supplied facts: A and B each score 6/8. Before running, the team predicted B would score higher.

Point to the given fact that matters most. Explain why it matters.

02. Follow the deciding steps

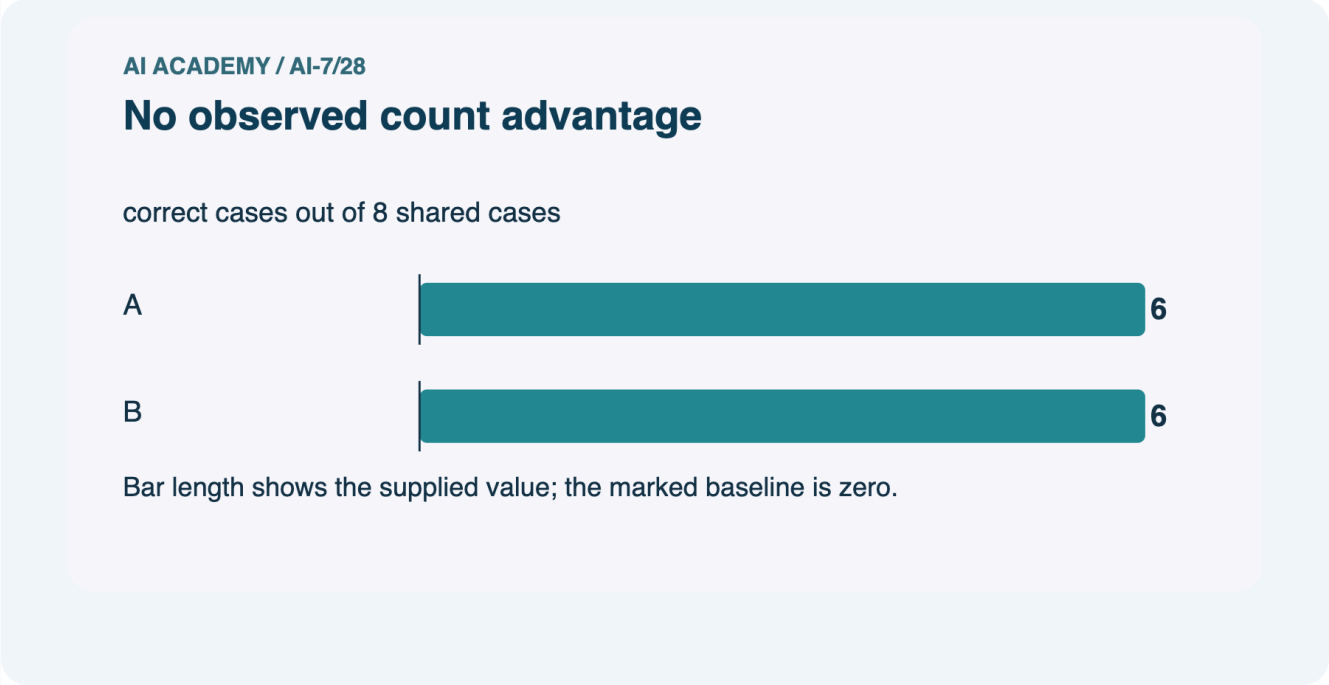

Follow the labelled picture with the matching explanation. Open the vector diagram

Recall the **prediction**: The claim was a higher correct count for B. → State the finding: Both versions score 75%; no observed count advantage appears here. → Revise cautiously: Report the unsupported **prediction** and a justified next test.

Point to each numbered stage and explain which recorded **input** it uses.

03. No observed count advantage

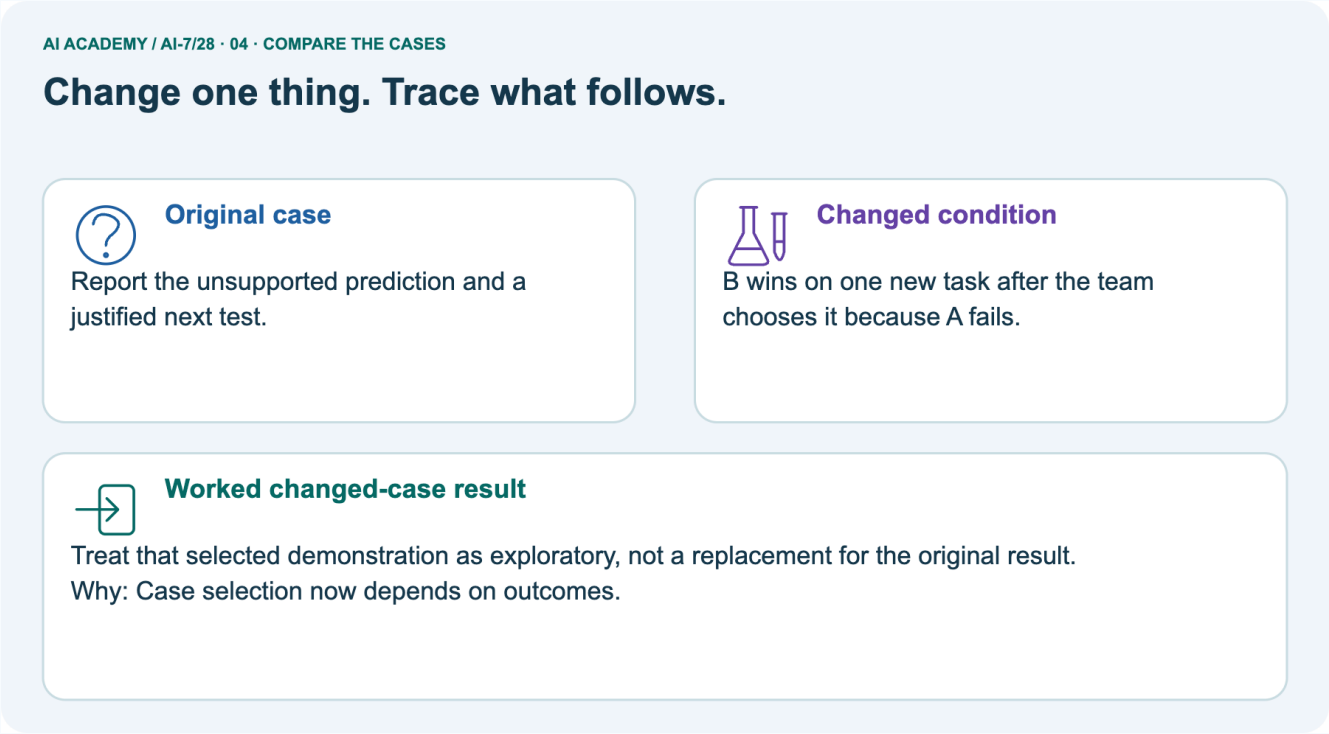

Follow the labelled picture with the matching explanation. Open the vector diagram

No observed count advantage. Units: correct cases out of 8 shared cases. A: 6. B: 6.

Read the labels and values. Explain the relationship the model shows.

04. Change one thing. Trace what follows.

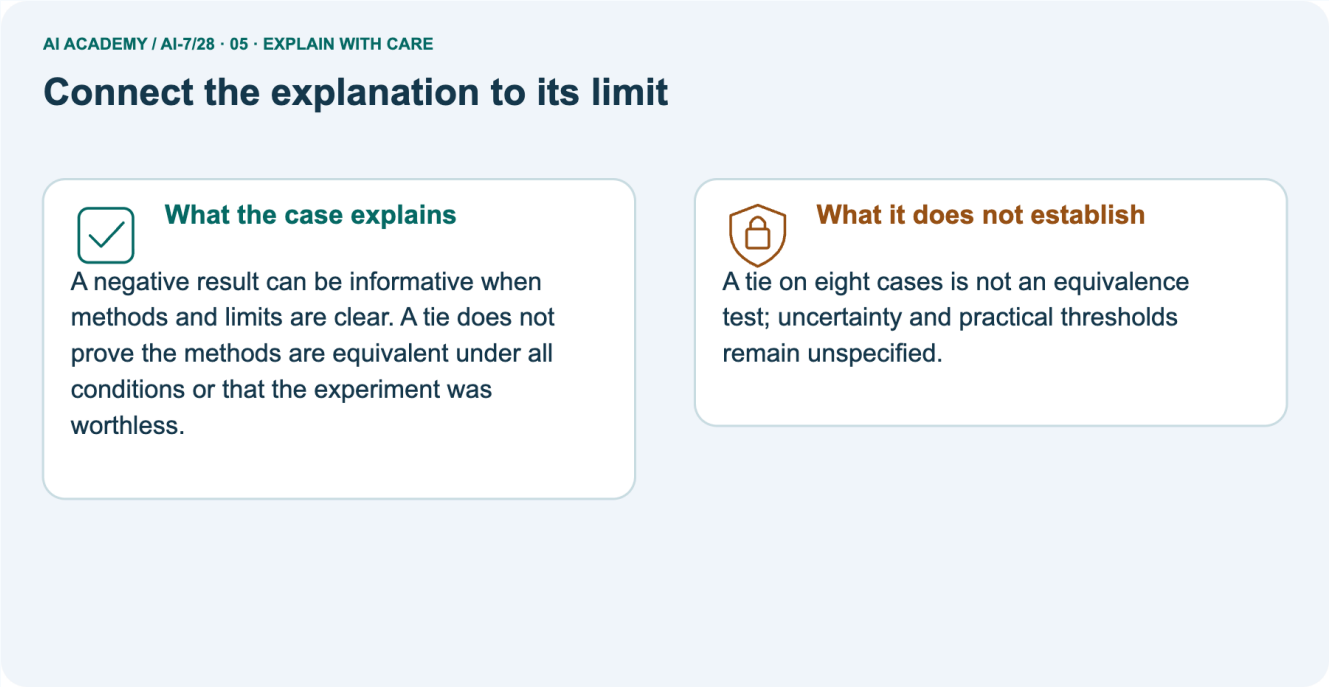

Follow the labelled picture with the matching explanation. Open the vector diagram

Original case: Report the unsupported **prediction** and a justified next test. Changed condition: B wins on one new task after the team chooses it because A fails.

Expected result: Treat that selected demonstration as exploratory, not a replacement for the original result. Reason: Case selection now depends on outcomes.

Predict before checking the worked changed-case result. Name what changed and what the supplied facts allow you to conclude.

05. Connect the explanation to its limit

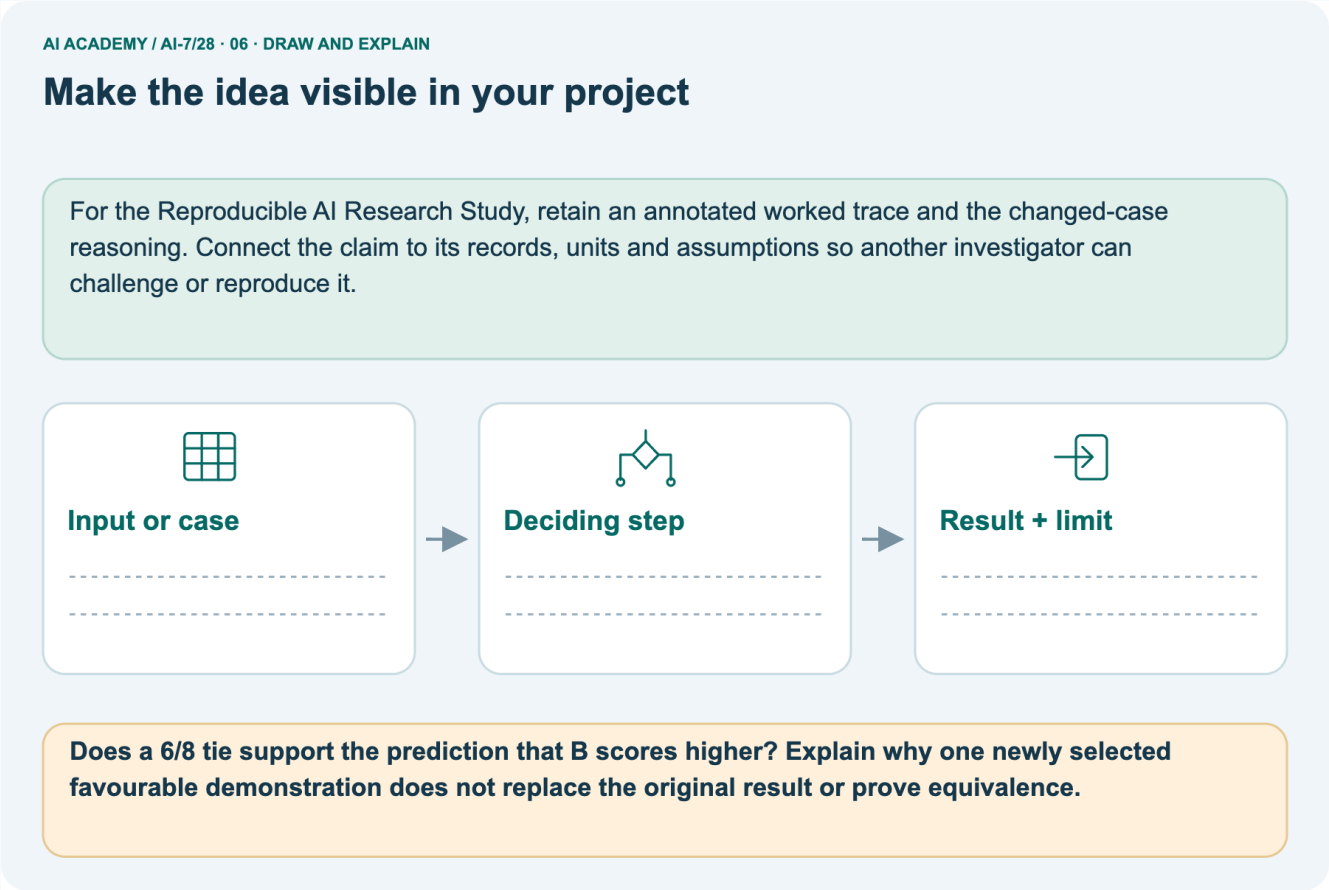

Follow the labelled picture with the matching explanation. Open the vector diagram

A **negative result** can be informative when methods and limits are clear. A tie does not prove the methods are equivalent under all conditions or that the experiment was worthless.

Limit: A tie on eight cases is not an **equivalence** test; uncertainty and practical thresholds remain unspecified.

Explain the case, then point to a limit on the claim.

06. Make the idea visible in your project

Follow the labelled picture with the matching explanation. Open the vector diagram

For the Reproducible AI Research Study, retain an annotated worked trace and the changed-case reasoning. Connect the claim to its records, units and assumptions so another investigator can challenge or reproduce it.

Draw your **input**, deciding step, result and limit. Supported question: Does a 6/8 tie support the **prediction** that B scores higher?

Explain why one newly selected favourable demonstration does not replace the original result or prove **equivalence**.

Draw your project trace and justify the deciding step using **evidence**.

▼ Earlier wording, alternatives and picture transcripts

01. Negative results and claim revision: the case

02. Follow the deciding steps
