

Effect size and practical importance

Project: Reproducible AI Research Study

1. Prepare the purpose, prerequisites and materials

Teach the learning cycle

Primary target: Explain the mechanism and terminology of effect size and practical importance

Session · Sequence and minutes · Resources

Session: Session 1 · Understand · 45 min

Sequence and minutes: 0–7: recall and prerequisite; 7–15: inspect the concrete case and predict; 15–30: teacher models the worked trace; 30–40: learners explain a step using the text and visual; 40–45: check the core idea.

Resources: Sections 1–6; record the brief recall in the workbook.

Session: Session 2 · Practise · 45 min

Sequence and minutes: 0–5: retrieve the procedure; 5–15: W2 completion practice; 15–23: explain and check with a partner; 23–30: each learner answers the misconception check; 30–40: targeted reteaching or a harder variation; 40–45: prepare the investigation.

Resources: Sections 7–10; use the matching workbook W2 and misconception check.

Session: Session 3 · Investigate and transfer · 45 min

Sequence and minutes: 0–5: retrieve the decision rule; 5–20: investigate or trace; 20–30: start the independent case; 30–38: connect the project; 38–43: act on feedback; 43–45: plan the return check.

Resources: Sections 9 and 11–14. Give extra time to finish the full task set; use Section 15 when the week includes a coding lab.

This is a starting allocation of 135 minutes, not a validated duration. Preserve all named topics. Schedule extra time for connected examples, the full investigation, independent cases and project building. Repeated copies of a case share one recorded attempt; they are not new evidence.

Retrieval answer guidance

Uncertainty intervals

Without opening the old lesson, explain one key idea from Uncertainty intervals. Give an example and a mistake that the idea helps you avoid.

Look for: Explain the mechanism and terminology of uncertainty intervals

Reference example, not the only acceptable wording: Teacher explanation: An uncertainty interval needs a sampling model and assumptions. A confidence level refers to the repeated-sampling method, not a probability attached to a fixed unknown parameter after observing data. For this constructed exercise assume independent normal measurements with known population standard deviation². A 95% mean interval uses supplied normal critical value 1.96: mean plus/minus $1.96 \cdot \sigma / \sqrt{n}$. Unknown sigma requires a different justified method.

Confounders and controls

Without opening the old lesson, explain one key idea from Confounders and controls. Give an example and a mistake that the idea helps you avoid.

Look for: Explain the mechanism and terminology of confounders and controls

Reference example, not the only acceptable wording: Teacher explanation: A confounder changes alongside the intended factor and can offer another explanation. Controls aim to isolate the proposed mechanism. For a toy comparison vary only retrieval method while holding corpus, queries, cutoff and relevance rubric fixed. Randomise or counterbalance order when order effects matter.

Hypotheses and measurable outcomes

Without opening the old lesson, explain one key idea from Hypotheses and measurable outcomes. Give an example and a mistake that the idea helps you avoid.

Look for: Explain the mechanism and terminology of hypotheses and measurable outcomes

Reference example, not the only acceptable wording: Teacher explanation: A hypothesis predicts a measurable comparison under stated conditions. Declare primary outcome and direction before inspecting results. Toy hypothesis: method B improves supported-answer rate over baseline A on a reserved paired set. Define support rubric and failure treatment; record secondary outcomes separately.

Two 45-minute sessions. Effect size describes magnitude on a stated scale. Practical importance depends on task requirements, not merely a nonzero difference. Use the supplied constructed scenarios to make the mechanism inspectable. Collect W4 before sharing solutions. Students should name intermediate evidence and limitations; classroom pacing and learning effectiveness remain unvalidated.

Outcomes

Explain the mechanism and terminology of effect size and practical importance

Apply the stated procedure to a new case with a traceable result

Identify an assumption or limitation and design a revealing follow-up

Preparation

Lesson and workbook; paper and pencil

Calculator and optional local Python 3 for arithmetic; no live API or private data

Prepare the fresh retry separately and withhold its solution until after collection

Prerequisite answer

A result depends on the inputs, procedure and conditions that produced it. Preserve data roles and distinguish observed outcomes from predictions or unmeasured conditions. If the prior concept cannot be explained, use a short retrieval activity before this chapter.

End goal for the pictorial case

Explain effect size and practical importance using the records and boundaries of this fictional investigation.

This added worked case illustrates the week's main idea. Retain all original and connected topics; schedule its practice within the teaching cycle.

2. Explain and model the mechanism

Effect size describes magnitude on a stated scale. Practical importance depends on task requirements, not merely a nonzero difference.

Begin by writing the question the procedure is intended to answer. Identify the information already supplied, the information it will produce and the information still missing. These are constructed classroom examples; they do not require live accounts, private records or an external service. Do not treat a plausible explanation as a measured outcome.

For paired response durations compute baseline minus candidate per case and average the differences. Positive means faster candidate. Compare with a prespecified minimum useful gain.

Before applying the procedure, write its units, denominator or decision boundary where relevant. A partner should be able to repeat each step using the same inputs. If a required input is absent or violates the stated contract, record that condition explicitly instead of quietly replacing it with a convenient value.

Term · Meaning

Term: Effect size

Meaning: The magnitude of a difference under a declared scale

Term: Paired difference

Meaning: A within-unit comparison

Term: Practical threshold

Meaning: A prespecified magnitude considered useful

Effect size and practical importance — evidence trace

Input and scope · Check or calculation · Conclusion and limit

Input and scope: Baseline times 10, 12, 8; candidate 8, 9, 7 seconds. Useful gain threshold 2 seconds.

Check or calculation: For paired response durations compute baseline minus candidate per case and average the differences. Positive means faster candidate. Compare with a prespecified minimum useful gain.

Conclusion and limit: Paired gains 2, 3, 1; mean 2 meets the inclusive useful-gain threshold. It is a three-case descriptive result, not a population certainty.

The figure connects this chapter's worked input, declared procedure and result. Read the complete worked reasoning for qualifiers and intermediate steps; the abbreviated labels do not replace that reasoning.

Guided: Paired gains 2, 3, 1; mean 2 meets the inclusive useful-gain threshold. It is a three-case descriptive result, not a population certainty. Qualification: A meaningful sample effect may remain statistically uncertain; statistical significance can also concern a practically tiny effect. Exit: accept a concrete variation with its predicted outcome and a stated condition that would challenge the mechanism; reject a claim resting on unmeasured evidence.

Model the reasoning aloud

Use the complete worked example below before asking learners to complete W2. Reveal a small part, invite a prediction, then explain the deciding step. These teacher notes contain solutions; do not reveal the independent case answer during modelling.

Baseline times 10, 12, 8; candidate 8, 9, 7 seconds. Useful gain threshold 2 seconds.

Paired gains 2, 3, 1; mean 2 meets the inclusive useful-gain threshold. It is a three-case descriptive result, not a population certainty.

Compare the intermediate evidence with the final statement. Explain why each number or decision follows from the stated inputs. The conclusion belongs to this scenario and procedure; changing the inputs, evaluation population or authority can change what it establishes. Retain the raw record so a later revision can be compared honestly.

Optional local lab: predict the printed result before running this standalone Python 3 example. Change one relevant boundary input, record the outcome and state the contract or statistical assumptions. The program

uses fictional values and the Python standard library; it performs no external operations.

```
def paired_gain(baseline, candidate):  
    if not baseline or len(baseline) != len(candidate):  
        raise ValueError('paired lengths')  
    differences = [a - b for (a, b) in zip(baseline, candidate)]  
    return (differences, sum(differences) / len(differences))  
  
print(paired_gain([10, 12, 8], [8, 9, 7]))
```

Thinking move · Teacher prompt

Thinking move: Plan

Teacher prompt: What is given? What is the question? Which procedure fits these facts?

Thinking move: Do

Teacher prompt: Point to each input and intermediate step in the worked trace. Name the rule that allows the next step.

Thinking move: Check

Teacher prompt: Does the output answer the question? Which assumption or limitation prevents a larger claim?

Use the diagram and verbal explanation together. Ask learners to match a sentence to a specific visual step; do not assign learners fixed visual or auditory learning styles.

A pictorial worked case: Effect size and practical importance

An improvement with a practical threshold. A team compares error rates against a predeclared practical threshold.

The facts we will use

A makes 20 errors in 1000 tasks; B makes 15. Practical improvement requires at least 10 fewer errors per 1000.

Errors on 1000 tasks

errors per 1000 tasks

Bar length shows the supplied value; the marked baseline is zero.

Effect size and practical importance

Start with the supplied facts

Follow each arrow. Ask which fact allows the next step.

1. Compute rates

A is 2%; B is 1.5%.

2. Compute effect size

B has 5 fewer errors per 1000, a 0.5-percentage-point reduction.

3. Apply practical threshold

Five is less than ten, so the observed change misses this threshold.

CHANGE ONE THING

B makes 8 errors in 1000.

Explain the changed result using the matching lesson.

Read the picture one step at a time

Step · What happens and why

Step: 1. Compute rates

What happens and why: A is 2%; B is 1.5%.

Step: 2. Compute effect size

What happens and why: B has 5 fewer errors per 1000, a 0.5-percentage-point reduction.

Step: 3. Apply practical threshold

What happens and why: Five is less than ten, so the observed change misses this threshold.

Match each pictured step to the supplied facts. This is a worked teaching case, not an independent assessment.

Why this result follows

Effect size describes how much the outcome changes. Practical importance depends on the real decision criterion; relative changes can sound large while absolute changes remain small.

What this example does not establish

No uncertainty or statistical significance is supplied; these counts alone cannot establish a general effect.

Change one thing in the pictured case

Change: B makes 8 errors in 1000.

Prediction: The reduction becomes 12 per 1000 and meets the stated practical threshold.

Reason: Twenty minus eight exceeds the required ten fewer errors.

Ask while showing the picture

Cover the result. Ask learners to name the inputs and predict the next step. Uncover one step, connect the icon to the actual procedure, and explain its evidence. Then change the supplied condition and compare. The picture is a representation; it does not document execution of a real AI model.

3. Demonstrate and guide practice

Time or stage · Teacher action

Time or stage: Session 1: 0–7 minutes

Teacher action: Retrieve the prerequisite; identify the input, procedure and evidence source.

Time or stage: 7–18 minutes

Teacher action: Explain section 1 and vocabulary. Complete W1 with a mechanism-based explanation.

Time or stage: 18–32 minutes

Teacher action: Trace the declared procedure and worked case. Complete W2, recording intermediate steps.

Time or stage: 32–45 minutes

Teacher action: Discuss the diagram with the worked input; use W3 to distinguish measured claims and limitations.

Time or stage: Session 2: 0–8 minutes

Teacher action: Retrieve the worked reasoning and collect the guided response before discussing it.

Time or stage: 8–20 minutes

Teacher action: Compare a proposed boundary variant with the original case; identify what remains fixed.

Time or stage: 20–35 minutes

Teacher action: Collect W4 independently. Require the procedure trace and the bounded conclusion.

Time or stage: 35–45 minutes

Teacher action: Use W5 and exit responses for feedback. Administer the fresh retry after feedback and preserve both attempts.

Use the worked example in Sections 3 and 6. Collect a prediction before revealing its result; ask the learner to point to each intermediate fact.

Provide an input/procedure/result/limit frame and a calculator when needed. Ask students to identify the first step before completing the whole trace. Extension: compare two concrete variants of this mechanism while holding unrelated conditions fixed; report both successful and unsuccessful outcomes.

Reduce help deliberately

Completion task: Baseline times 10, 12, 8; candidate 8, 9, 7 seconds. Useful gain threshold 2 seconds. Show the intermediate steps and give the conclusion with its scope.

Teacher check: Teacher explanation: Paired gains 2, 3, 1; mean 2 meets the inclusive useful-gain threshold. It is a three-case descriptive result, not a population certainty.

Start by identifying the given inputs together. Leave the intermediate steps blank. If needed, model one step, then withdraw that help on the next step. Move to a full trace only when the partial trace is understood. For partners, alternate explainer and checker; collect a response from every learner before discussion.

Individual reasoning check

Use the worked case for Effect size and practical importance. Proposed explanation: “The worked result establishes every future case”. Decide whether this explanation is supported. Point to the step or supplied fact that decides; explain your repair if needed.

Expected correction: A meaningful sample effect may remain statistically uncertain; statistical significance can also concern a practically tiny effect.

Collect explanations, not only yes/no votes. If a misunderstanding is common, re-model the relevant step for the class. If it affects a few learners, give a short targeted group explanation while others solve a more demanding variation.

Pictorial practice question

Calculate the absolute error-rate reduction from 20/1000 to 15/1000. Does it meet the ten-fewer-errors threshold, and what changes when B has eight errors?

Reasoned teacher answer

A is 2%; B is 1.5%. B has 5 fewer errors per 1000, a 0.5-percentage-point reduction. Five is less than ten, so the observed change misses this threshold. Changed case: The reduction becomes 12 per 1000 and meets the stated practical threshold. Twenty minus eight exceeds the required ten fewer errors.

Changed-case reasoning: The reduction becomes 12 per 1000 and meets the stated practical threshold. Twenty minus eight exceeds the required ten fewer errors.

Collect each learner’s explanation before discussion. Use the first missing connection between input, deciding step and result to choose support. This question is worked-case practice, not fresh mastery evidence.

4. Run the investigation and diagnose misconceptions

The worked result establishes every future case: A meaningful sample effect may remain statistically uncertain; statistical significance can also concern a practically tiny effect.

A missing input may be replaced without recording the change: A replacement changes the evidence or contract. Record the change and its justification; do not silently turn unknown into a measured value.

Repeating an assessed case is new independent evidence: A replay checks consistency. An example used for feedback or revision cannot later be described as untouched final evaluation.

Use Section 9 for the evidence ledger. Add a boundary or missing-input case and record the expected response before checking. More successful repeats of one case do not establish wider coverage.

Match the support to the first error

What the response shows · Next teaching action

What the response shows: Missing or misread facts

Next teaching action: Read the case aloud, mark supplied versus unknown facts, and let the learner restate it.

What the response shows: Wrong procedure

Next teaching action: Return to the deciding step in the worked case. Contrast it with the proposed incorrect explanation.

What the response shows: Arithmetic or implementation error

Next teaching action: Trace intermediate values or lines; preserve the first mismatch and retry that step.

What the response shows: Correct result without a reason

Next teaching action: Ask for a trace and a changed case before marking independent understanding.

What the response shows: An unsupported wider claim

Next teaching action: Ask which supplied evidence supports the claim and which further observation would be needed.

Offer an oral explanation, drawing, enlarged visual or fewer examples when that removes a reading/writing barrier. Keep the same reasoning goal. Stretch secure learners by changing a boundary or assumption and asking them to defend the effect, not simply by assigning more of the same questions.

5. Assess and explain the answers

Guided and exit questions

Guided: Paired gains₂, 3, 1; mean₂ meets the inclusive useful-gain threshold. It is a three-case descriptive result, not a population certainty. Qualification: A meaningful sample effect may remain statistically uncertain; statistical significance can also concern a practically tiny effect. Exit: accept a concrete variation with its predicted outcome and a stated condition that would challenge the mechanism; reject a claim resting on unmeasured evidence.

W1 Explain the mechanism

Explain the weekly mechanism in your own words. Use the worked scenario to name its input, decision rule and output.

Teacher explanation: Effect size describes magnitude on a stated scale. Practical importance depends on task requirements, not merely a nonzero difference. For paired response durations compute baseline

minus candidate per case and average the differences. Positive means faster candidate. Compare with a prespecified minimum useful gain.

W2 Trace the worked case

Baseline times 10, 12, 8; candidate 8, 9, 7 seconds. Useful gain threshold 2 seconds. Show the intermediate steps and give the conclusion with its scope.

Teacher explanation: Paired gains 2, 3, 1; mean 2 meets the inclusive useful-gain threshold. It is a three-case descriptive result, not a population certainty.

W3 Audit the limit

A report omits this qualification: A meaningful sample effect may remain statistically uncertain; statistical significance can also concern a practically tiny effect. Explain how omitting it could change a reader's interpretation, and write an accurate replacement.

Teacher explanation: A meaningful sample effect may remain statistically uncertain; statistical significance can also concern a practically tiny effect. State the observed result separately from the unverified or out-of-scope claim; preserve the original evidence rather than inventing a missing fact.

W4 Apply a new case independently

Baseline 6, 8, 10; candidate 5, 7, 9. Useful mean gain at least 1.5. Decide.

Teacher explanation: Gains 1, 1, 1; mean 1 fails 1.5 threshold despite positive sample improvement.

W5 Design a revealing follow-up

For the worked scenario, propose one additional case that could reveal a failure, describe its expected outcome before running it, and explain what would need to remain fixed for a fair comparison. Do not reuse W4 as a new final test after receiving feedback.

Teacher explanation: Accept a concrete variant of the worked input or a missing/conflicting/boundary condition, with an expectation derived from the declared procedure. Require preserved settings, original outputs and data roles. A meaningful sample effect may remain statistically uncertain; statistical significance can also concern a practically tiny effect. The new case should test this particular mechanism rather than merely restate the original result.

Independent assessment and fresh retry

W4: Gains 1, 1, 1; mean 1 fails 1.5 threshold despite positive sample improvement. Require intermediate reasoning and the stated scope. Fresh retry: Baseline 5, 7, 9; candidate 3, 5, 8; threshold 1.5. Expected reasoning: Gains 2, 2, 1; mean $5/3 \approx 1.667$ meets threshold on three cases. If students need support, record it and reassess with another new case rather than awarding independence to a copied answer.

Assess independent transfer

Selected case: Baseline 6, 8, 10; candidate 5, 7, 9. Useful mean gain at least 1.5. Decide.

Selected case answer

Teacher explanation: Gains1, 1, 1; mean1 fails1.5 threshold despite positive sample improvement.

Dimension · Evidence required

Dimension: Explanation

Evidence required: Names the applicable idea or procedure and ties it to the supplied facts.

Dimension: Trace and result

Evidence required: Preserves the given inputs and shows the relevant intermediate steps; distinguishes a prediction from an observed execution.

Dimension: Limits

Evidence required: States the assumptions, missing evidence or conditions under which the result would change.

Record each dimension as not yet, with support, or independent. Accept a valid alternative procedure with a defensible trace. Do not penalise an honestly recorded model failure if the learner correctly explains its evidence and limits.

Feedback that the learner uses

Name the earliest unsupported step and give one action to repair it. Have the learner make that repair now and explain why. Then assess the relevant skill on a fresh, fully specified case. Confirm it was not previously practised with feedback; solve and check the new case before assigning it. A follow-up design prompt is a starting brief, not automatically an equivalent test.

6. Connect the project, support and next lesson

Add a labelled effect size and practical importance evidence sheet to Reproducible AI Research Study. Show how you can explain the mechanism and terminology of effect size and practical importance. Use the supplied fictional case and keep its inputs, intermediate steps, calculation or prediction, and limitation. Connect this record to last week's record; a matching answer without a trace is insufficient.

Provide an input/procedure/result/limit frame and a calculator when needed. Ask students to identify the first step before completing the whole trace. Extension: compare two concrete variants of this mechanism while holding unrelated conditions fixed; report both successful and unsuccessful outcomes.

Next connection: Statistical tests and assumptions. Preserve the current case record and retrieve its evidence boundary before moving on.

Retain the project ledger and assess a changed case after support. Check the relevant prerequisite before carrying this component forward.

Plan the delayed return

Suggested return points in this level: ai-7/14, ai-7/16, ai-7/19. Use actual classroom dates, adjusting for holidays and gaps. One, three and six teaching weeks are scheduling choices, not a claimed optimal spacing.

At a delayed check, ask for the idea from memory and a changed application. Compare with the earlier independent response and record support used. For a new level, revisit the previous capstone before checking the new prerequisites.

Record · Teacher evidence

Record: Learner code and date

Teacher evidence: _____

Record: Concept and case used; prior exposure

Teacher evidence: _____

Record: Explanation / trace / limits

Teacher evidence: _____

Record: Support and first repair

Teacher evidence: _____

Record: Changed case and delayed outcome

Teacher evidence: _____

Record: Next teaching action

Teacher evidence: _____

Use the evidence to choose reteaching or the next step. A completed page, confidence rating or attractive project does not by itself demonstrate understanding.

Project evidence from this case

For the Reproducible AI Research Study, retain an annotated worked trace and the changed-case reasoning. Connect the claim to its records, units and assumptions so another investigator can challenge or reproduce it.

7. Prepare, teach and assess

Teaching target: Explain the mechanism and terminology of effect size and practical importance

Prepare the labelled worked-case picture, the matching workbook, fictional input cards and a place for individual responses. Check a local Python 3 environment before class; have a paper-trace version ready.

Session · Plan · Resources

Session: Session 1 · Understand · 45 min

Plan: 0–7: recall and prerequisite; 7–15: inspect the concrete case and predict; 15–30: teacher models the worked trace; 30–40: learners explain a step using the text and visual; 40–45: check the core idea.

Resources: Sections 1–6; record the brief recall in the workbook.

Session: Session 2 · Practise · 45 min

Plan: 0–5: retrieve the procedure; 5–15: W2 completion practice; 15–23: explain and check with a partner; 23–30: each learner answers the misconception check; 30–40: targeted reteaching or a harder variation; 40–45: prepare the investigation.

Resources: Sections 7–10; use the matching workbook W2 and misconception check.

Session: Session 3 · Investigate and transfer · 45 min

Plan: 0–5: retrieve the decision rule; 5–20: investigate or trace; 20–30: start the independent case; 30–38: connect the project; 38–43: act on feedback; 43–45: plan the return check.

Resources: Sections 9 and 11–14. Give extra time to finish the full task set; use Section 15 when the week includes a coding lab.

Before class, solve the supported practice: Baseline times 10, 12, 8; candidate 8, 9, 7 seconds. Useful gain threshold 2 seconds. Show the intermediate steps and give the conclusion with its scope.

Reasoned practice answer: Teacher explanation: Paired gains 2, 3, 1; mean 2 meets the inclusive useful-gain threshold. It is a three-case descriptive result, not a population certainty.

Check every learner before discussion: Use the worked case for Effect size and practical importance.

Proposed explanation: “The worked result establishes every future case”. Decide whether this explanation

is supported. Point to the step or supplied fact that decides; explain your repair if needed.

Misconception repair: A meaningful sample effect may remain statistically uncertain; statistical significance can also concern a practically tiny effect.

Support: read the exact case aloud, enlarge the labelled picture, supply input cards and model only the first deciding step. Accept a spoken explanation or drawing; retain the reasoning goal.

Extension: B makes 8 errors in 1000. Require a prediction and a reason before comparing. Expected result: The reduction becomes 12 per 1000 and meets the stated practical threshold. Reason: Twenty minus eight exceeds the required ten fewer errors.

Independent assessment: withhold the reserved answer until the learner has attempted the new case. Record support separately from correctness.

Criterion · Not yet · With support · Independent

Criterion: Explanation

Not yet: Names an answer without a deciding fact

With support: Uses a hint to link fact and decision

Independent: Explains the deciding fact in own words

Criterion: Trace or test

Not yet: Cannot connect input and result

With support: Completes steps with prompts

Independent: Traces or tests a changed case accurately

Criterion: Limits and revision

Not yet: Claims more than evidence supports

With support: Names a limit after a prompt

Independent: States a defensible limit and useful next test

Project checkpoint: Test changed cases. Keep normal, boundary and failure cases; compare expected and observed results.

Use the weekly teacher answer for topic-specific reasoning. A saved progress tick is an activity record; judge mastery from the learner's explanation and evidence.

8. Use feedback, labs and repair paths

Use the two formative questions as supported practice, not as independent mastery scores. Discuss the deciding evidence rather than accepting a guessed selection.

The feedback comes from the reviewed public worked case. Do not reveal the separately reserved independent teacher answer until the learner has attempted that case.

Ask students to predict before running code. Preserve errors and actual outputs; collect a changed test and an explanation. The branch-boundary and indexing lessons deliberately include failure cases.

Use the earlier worked-explanation links to address a specific missing building block, then return to the current question. Adapt this suggestion after observing the learner; it is not an automatic diagnosis.

Collect the completed-work portfolio as evidence. Record support separately from correctness, and assess explanation, trace/test and limitations. Progress ticks and quiz selections alone do not establish mastery.
