Visual Composition

Learn to understand, design, build, test and explain AI systems responsibly.

Project: Verified Study Buddy

THE CONNECTED WEEK

Teach spatial meaning with a disclosed reconstruction.

Supply prompt cards and a criterion checklist, preserve provenance review and assess the fresh spatial description.

Keep one habit: Ask which relation changed and whether the evidence came from a description, reconstruction or original output.

MAIN LESSON · SECTION 1

Prepare this connected week

> Use one main plan and keep practice separate from the independent first attempt.

Learning goal and precision

Primary target: Check object counts, spatial relations and arrow meaning separately

Two 45-minute sessions. An image generator constructs an **output** from learned patterns and a specification. A generated picture is not a record that the depicted event occurred.

Use the supplied constructed scenarios to make the **mechanism** inspectable. Collect W4 before sharing solutions.

Students should name intermediate **evidence** and limitations; classroom pacing and learning effectiveness remain unvalidated.

By the end, I can check object counts and spatial relations as separate visual requirements.

What to prepare

- Use the supplied scenario, student illustrations and blank paper. For numeric work, offer counters or a calculator after learners show the setup. Fictional records are supplied; personal data and paid accounts are unnecessary.
- Case exposure check: this source example appears in ai-3/10, ai-3/11. Reuse a familiar case for recall or modelling; verify that the case used to assess transfer has not already received feedback.
- Lesson and workbook; paper and pencil
- Calculator and optional local Python 3 for arithmetic; no live API or private data
- Prepare the fresh retry separately and withhold its solution until after collection

Main teaching plan

Session · Sequence and minutes · Resources

> **Session:** Session 1 · Understand · 45 min
>
> **Sequence and minutes:** 0–7: recall and prerequisite; 7–15: inspect the concrete case and predict; 15–30: teacher models the worked trace; 30–40: learners explain a step using the text and visual; 40–45: check the core idea.
>
> **Resources:** Sections 1–6; record the brief recall in the workbook.

> **Session:** Session 2 · Practise · 45 min
>
> **Sequence and minutes:** 0–5: retrieve the procedure; 5–15: W2 completion practice; 15–23: explain and check with a partner; 23–30: each learner answers the misconception check; 30–40: targeted reteaching or a harder variation; 40–45: prepare the investigation.

> **Resources:** Sections 7–10; use the matching workbook W2 and misconception check.

> **Session:** Session 3 · Investigate and transfer · 45 min
>
> **Sequence and minutes:** 0–5: retrieve the decision rule; 5–20: investigate or trace; 20–30: start the independent case; 30–38: connect the project; 38–43: act on feedback; 43–45: plan the return check.
>
> **Resources:** Use “Run the investigation”, “Connect your project”, “Show what you know”, “Study a complete case” and “Try a new case independently”. Give extra time for the full task set. If this week has a coding lab, use its named section; section numbers can change when extra explanations are included.

This is a starting allocation of 135 minutes, not a validated duration. Preserve all named topics. Schedule extra time for connected examples, the full investigation, independent cases and project building.

Repeated copies of a case share one recorded attempt; they are not new **evidence**.

Opening retrieval and readiness

Without opening the old lesson, explain one key idea from Image Generation Models. Give an example and a mistake that the idea helps you avoid.

Look for: Explain the **mechanism** and terminology of image generation and **provenance**

Reference example, not the only acceptable wording: Teacher explanation: An image generator constructs an **output** from learned patterns and a specification. A generated picture is not a record that the depicted event occurred.

Keep a **provenance** record containing specification, tool/version when known, generation date, edits, permissions and intended use. Label fictional imagery.

Inspect visual requirements and avoid inferring identity or event authenticity from appearance.

Without opening the old lesson, explain one key idea from Structured **Output** and Schemas. Give an example and a mistake that the idea helps you avoid.

Look for: Separate JSON parsing, schema validation and source support checks

Reference example, not the only acceptable wording: Teacher explanation: Parsing establishes grammatical JSON; schema checks enforce fields/types/conditional rules; semantic checks match the claims to sources and domain meaning.

None alone establishes all three.

Without opening the old lesson, explain one key idea from Prompt as a Contract. Give an example and a mistake that the idea helps you avoid.

Look for: Write a prompt specification with observable response criteria

Reference example, not the only acceptable wording: Teacher explanation: Fields status,room,capacity,source_ids.

Status supported or needs_review. supported requires matching current approval and current capacity for the same room; no unresolved conflict.

Count the specified objects, inspect label meaning and legibility, check each requested relation, and preserve the known production history. A generated or constructed illustration is not a record that the depicted event occurred.

▼ **Earlier wording, alternatives and picture transcripts**

Teach the learning cycle

Retrieval answer guidance

Image Generation Models

Structured Output and Schemas

Prompt as a Contract

Use the student module and workbook section with this exact week title. The worked case, independent question and answers below form one aligned lesson sequence.

What the learner must demonstrate

An image brief requires two trees, a bench between them and the sun upper-right. A result has all objects but the bench is left of both trees. Write a spatial test that detects this.

Concept to explain

Subject, **setting**, **framing**, **relationship**s, and constraints shape an image request.

Term	Meaning
subject	The main person, object or topic represented in an image or piece of content.
setting	A chosen configuration value that affects how a system operates.
framing	The way a question or situation is presented, which can influence interpretation.
relationship	A connection between quantities, events or concepts; an association need not be causal.

Prepare the class

This compact option is not the full-week schedule. Use the main teaching cycle and allow extra sessions for the investigation, independent work and project.

Allow 80 minutes: recall 8; explanation 12; worked demonstration 15; guided practice 20; independent assessment 15; project and reflection 10. Extend the lab into a second session when needed.

Preparation for the connected explanation

Readiness answer

End goal for the pictorial case

This added worked case illustrates the week's main idea. Retain all original and connected topics; schedule its practice within the teaching cycle.

MAIN LESSON · SECTION 2

Teach relationship checks before accepting an object list

> Use the complete brief and reconstructed layouts without implying a chemistry demonstration.

State the current checks and decisions

Current composition focus: original count/labels pass, position/flow fail. Move-bottles-only fixes position while preserving wrong semantic endpoints. The native image is a reconstruction, not the absent original output. A left-to-right arrow can still be wrong if it starts at the wrong object. Keep the old poster/provenance examples as related review.

Check	Evidence required by the brief
Count	Exactly two bottles and one beaker
Labels	B1 and B2 identify the bottles legibly
Position	Both bottles are left of the beaker
Flow	Exactly one arrow starts at the bottle pair and points toward the beaker
Scope	A layout reconstruction is not an original generator output or chemistry observation

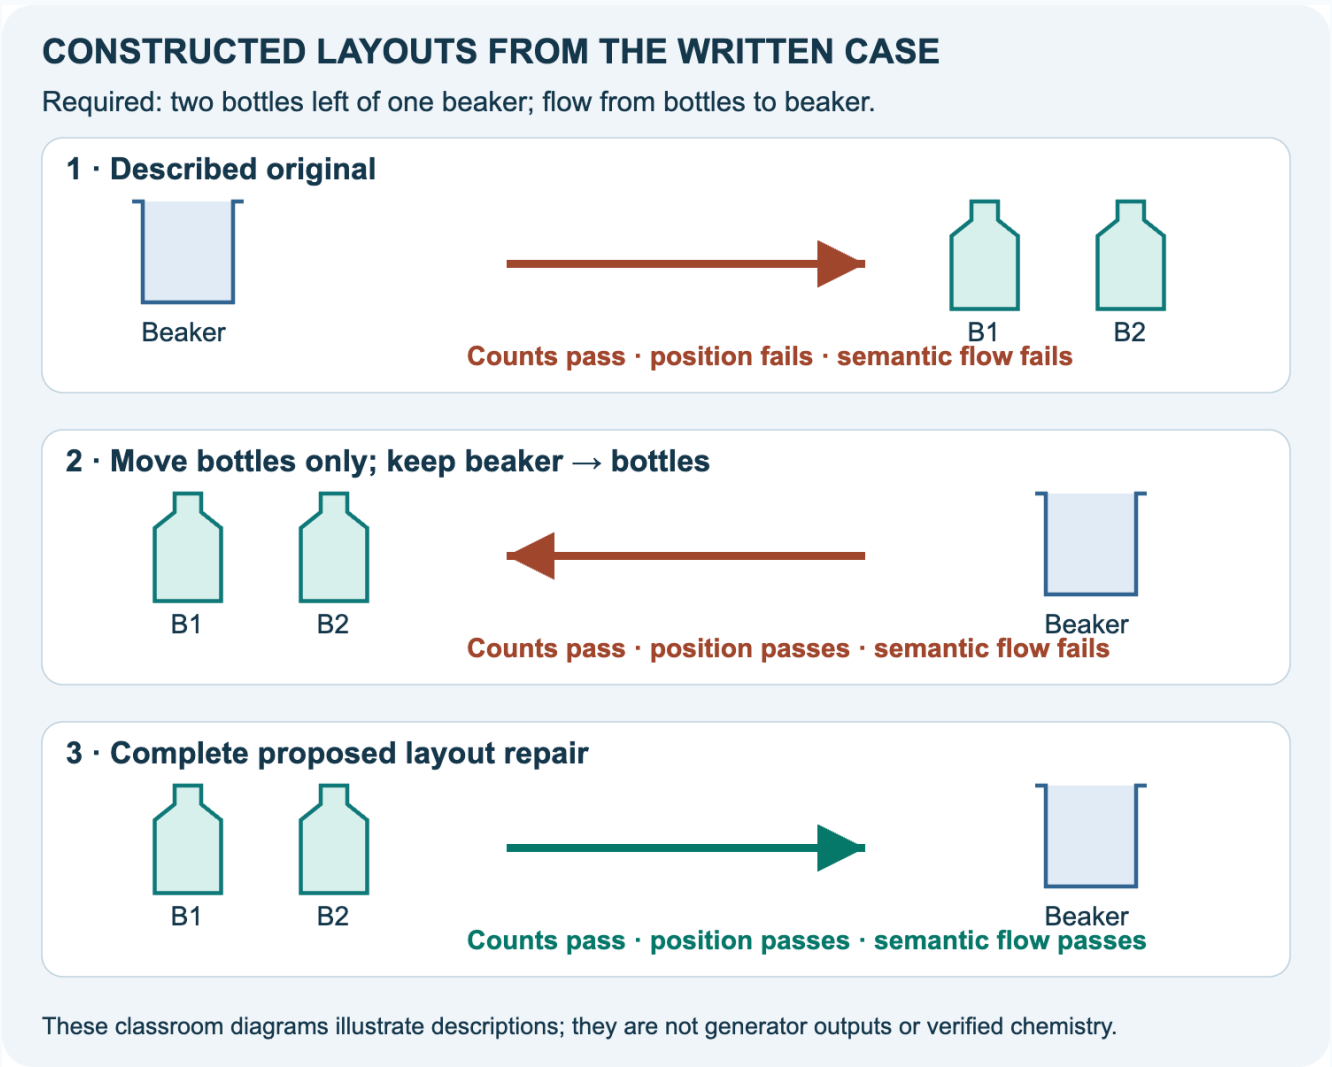

Read the main written case

A fictional Study Buddy requests a science-poster layout, then audits a supplied drawing description.

Brief: exactly two labelled bottles left of one beaker; one arrow from bottles toward beaker.

Supplied drawing description: two labelled bottles are right of a beaker; an arrow points from beaker toward bottles.

Inspect the three reconstructed layouts

Trace the deciding relations

AI ACADEMY / AI-3/11 · 02 · TRACE THE CASE

Follow the deciding steps

01 Count objects

Two bottles and one beaker satisfy the count requirement.

02 Check position

Bottles on the right fail the required left-of relation.

03 Check direction

Arrow from beaker to bottles reverses the required flow.

04 Repair brief

Specify bottles-left, beaker-right, arrow left-to-right; verify the revised output.

Follow the labelled picture with the matching explanation. Open the vector diagram

Read the picture one step at a time

STEP	WHAT HAPPENS AND WHY
1. Count objects	Two bottles and one beaker satisfy the count requirement.
2. Check position	Bottles on the right fail the required left-of relation.
3. Check direction	Arrow from beaker to bottles reverses the required flow.
4. Repair brief	Specify bottles-left, beaker-right, arrow left-to-right; verify the revised output.

Match each pictured step to the supplied facts. This is a worked teaching case, not an independent assessment.

Having every requested object is not the same as conveying the requested **relationship**. Position and arrow direction can change a scientific explanation while object counts remain correct.

Audit the provided description honestly: no actual image was supplied, so this evaluation concerns its stated layout rather than a claimed visual inspection.

Predict and explain moving bottles only

Change: Move bottles left of the beaker but keep the arrow pointing from beaker toward bottles.

Prediction: Position now passes; arrow direction still fails.

Reason: Changing object placement does not automatically reverse an arrow's semantic source and destination.

State the factual-content limit

A compliant layout does not by itself verify the chemistry or procedure represented; content needs source checking.

Cover the result. Ask learners to name the **input**s and predict the next step. Uncover one step, connect the icon to the actual procedure, and explain its **evidence**. Then change the supplied condition and compare.

The picture is a representation; it does not document execution of a real AI model.

▼ Earlier wording, alternatives and picture transcripts

Explain the mechanism

Input → **Process** → **Output**

Trace the information. At each stage, ask what changed and how you could test it.

Which stage could fail even when the other two are correct? Explain:

Predict first. Then check each step. A correct answer without visible reasoning is incomplete **evidence**.

1. Prompt names a robot and child but not their **relationship**.

2. Model may place them far apart or reverse who teaches whom.

3. Add action, viewpoint, spacing, and must-show constraints.

4. Evaluate whether composition communicates the learning idea without misleading detail.

Recalculate, retrace, or restate the reasoning in your own representation:

CHECK Did the **evidence** answer the exact question? Did the total, path, or source record stay consistent?

Concrete teaching case

Brief: large tree left, small bicycle right, open sky above. **Output** puts bicycle left.

Create a visual checklist.

Exact explanation to model

Check **subject**s, relative size, positions and sky separately. The position violates composition even if **subject**s exist.

Explain the added worked example

An image generator constructs an **output** from learned patterns and a specification. A generated picture is not a record that the depicted event occurred.

Begin by writing the question the procedure is intended to answer. Identify the information already supplied, the information it will produce and the information still missing.

These are constructed classroom examples; they do not require live accounts, private records or an external service. Do not treat a plausible explanation as a measured outcome.

Keep a **provenance** record containing specification, tool/version when known, generation date, edits, permissions and intended use. Label fictional imagery.

Inspect visual requirements and avoid inferring identity or event authenticity from appearance.

Before applying the procedure, write its units, denominator or decision boundary where relevant. A partner should be able to repeat each step using the same **input**s.

If a required **input** is absent or violates the stated contract, record that condition explicitly instead of quietly replacing it with a convenient value.

Key terms

Term	Meaning
Provenance	Recorded origin and transformation history
Visual criterion	A stated requirement checked against an image
Authenticity claim	A claim about the source or reality of depicted content

Model the reasoning aloud

Use the complete worked example below before asking learners to complete W2. Reveal a small part, invite a **prediction**, then explain the deciding step.

These teacher notes contain solutions; do not reveal the independent case answer during modelling.

A fictional poster requires exactly three labelled circles. Generated image shows four circles and one unreadable label. A caption calls it a photograph of a real lesson.

It fails count and label criteria; the photograph claim is unsupported. Record it as a generated fictional illustration and revise or reject before use.

Compare the intermediate **evidence** with the final statement. Explain why each number or decision follows from the stated **input**s.

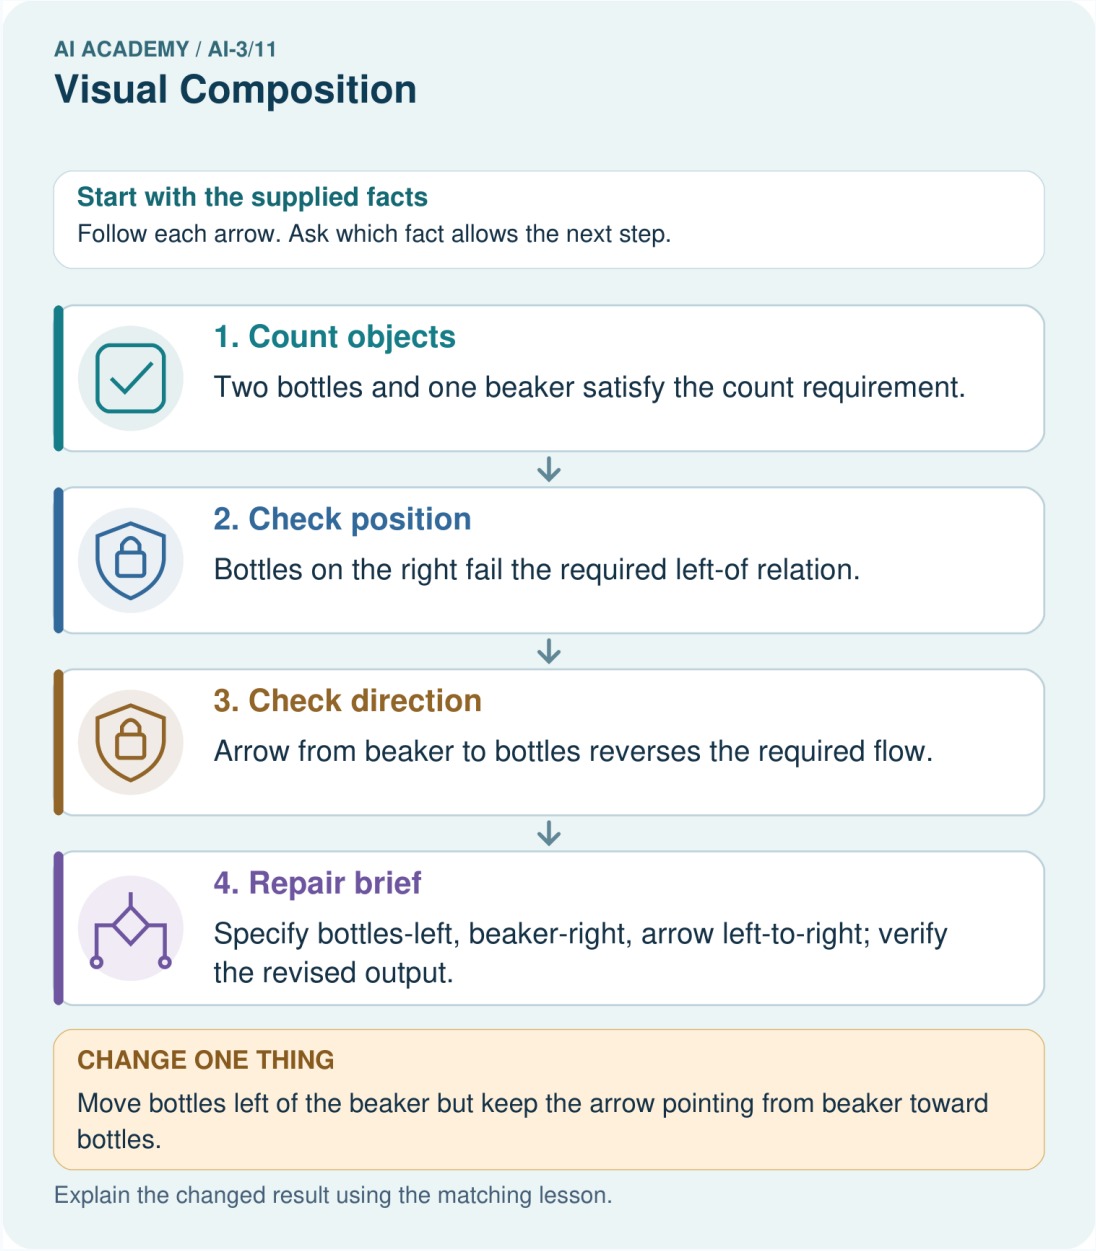

The conclusion belongs to this scenario and procedure; changing the **input**s, evaluation population or authority can change what it establishes. Retain the raw record so a later revision can be compared honestly.

Thinking move	Teacher prompt
Plan	What is given? What is the question? Which procedure fits these facts?
Do	Point to each input and intermediate step in the worked trace. Name the rule that allows the next step.
Check	Does the output answer the question? Which assumption or limitation prevents a larger claim?

Use the diagram and verbal explanation together. Ask learners to match a sentence to a specific visual step; do not assign learners fixed visual or auditory learning styles.

A pictorial worked case: Visual Composition

The facts we will use

Follow the labelled picture with the matching explanation. Open the vector diagram

Why this result follows

What this example does not establish

Change one thing in the pictured case

Ask while showing the picture

MAIN LESSON · SECTION 3

Guide spatial reasoning, then remove help

> Collect criterion-level evidence from every learner.

Current completion task and key

For the main original and move-bottles-only descriptions, judge count, bottle labels, left-of position and semantic arrow flow separately. Give the passing evidence and the remaining repair. State whether you inspected an original model image or a classroom reconstruction.

Original: counts and bottle labels pass; position fails; flow beaker→bottles fails. Moving bottles left preserves count/labels and fixes position but not semantic flow. Reverse the flow to bottles→beaker for a complete proposed layout. These are supplied descriptions and native reconstructions, not actual generator outputs or verified chemistry.

Current individual check

The supplied layout has every requested object, but the arrow starts at the wrong object. Does correct object presence establish the required meaning? Explain.

Expected correction: object presence does not establish the required source/destination relationship. Name the wrong endpoint and preserve the correct count.

Pictorial changed-case reasoning

Which checks pass after that single change, and what still needs repair?

Counts and left-of position pass. Direction still fails: arrow must originate at bottles and point toward beaker.

Changed-case reasoning: Position now passes; arrow direction still fails. Changing object placement does not automatically reverse an arrow’s semantic source and destination.

Collect each learner’s explanation before discussion. Use the first missing connection between **input**, deciding step and result to choose support. This question is worked-case practice, not fresh mastery **evidence**.

Keep each learner explaining

Say: Predict first. Show the rule, information path or calculation that would produce the result. A correct guess is not yet an explanation.

Reveal reasoning one step at a time. Explain why a tempting alternative fails. Write units and denominators for arithmetic, trace conditions for decisions, and identify supporting sources for claims.

Model these guided questions

<details>
<summary>Earlier wording, alternatives and picture transcripts</summary>

Demonstrate and guide practice

Board sequence

Write the given facts: Brief: large tree left, small bicycle right, open sky above. **Output** puts bicycle left.

Write the question to explain: Create a visual checklist.

Reveal after **prediction**s: Check **subject**s, relative size, positions and sky separately. The position violates composition even if **subject**s exist.

Use the earlier changed question as optional later practice. Reserve Audit a new spatial description independently for the first independent attempt before hints or feedback.

Classroom dialogue

Ask: Which facts are given, and which would we have to assume? Learners mark relevant details before discussing answers.

In pairs, one learner solves while the other checks **evidence**; exchange roles. Remove the worked answer before independent assessment.

Guided: It fails count and label criteria; the photograph claim is unsupported. Record it as a generated fictional illustration and revise or reject before use.

Qualification: **Provenance** tracks production history; it does not prove the content is accurate or establish every legal permission.

Exit: accept a concrete variation with its predicted outcome and a stated condition that would challenge the **mechanism**; reject a claim resting on unmeasured **evidence**.
</details>

Case-specific teaching sequence

Stage	Teacher action
Session 1: 0–7 minutes	Retrieve the prerequisite; identify the input, procedure and evidence source.
7–18 minutes	Explain section 1 and vocabulary. Complete W1 with a mechanism-based explanation.
18–32 minutes	Trace the declared procedure and worked case. Complete W2, recording intermediate steps.
32–45 minutes	Discuss the diagram with the worked input; use W3 to distinguish measured claims and limitations.
Session 2: 0–8 minutes	Retrieve the worked reasoning and collect the guided response before discussing it.
8–20 minutes	Compare a proposed boundary variant with the original case; identify what remains fixed.
20–35 minutes	Collect W4 independently. Require the procedure trace and the bounded conclusion.
35–45 minutes	Use W5 and exit responses for feedback. Administer the fresh retry after feedback and preserve both attempts.

Reduce help deliberately

Completion task: A fictional poster requires exactly three labelled circles. Generated image shows four circles and one unreadable label. A caption calls it a photograph of a real lesson.

Show the intermediate steps and give the conclusion with its scope.

Teacher check: Teacher explanation: It fails count and label criteria; the photograph claim is unsupported. Record it as a generated fictional illustration and revise or reject before use.

Start by identifying the given **input**s together. Leave the intermediate steps blank. If needed, model one step, then withdraw that help on the next step. Move to a full trace only when the partial trace is understood.

For partners, alternate explainer and checker; collect a response from every learner before discussion.

Individual reasoning check

Use the worked case for Image generation and **provenance**. Proposed explanation: “The worked result establishes every future case”. Decide whether this explanation is supported.

Point to the step or supplied fact that decides; explain your repair if needed.

Expected correction: **Provenance** tracks production history; it does not prove the content is accurate or establish every legal permission.

Collect explanations, not only yes/no votes. If a misunderstanding is common, re-model the relevant step for the class.

If it affects a few learners, give a short targeted group explanation while others solve a more demanding variation.

Pictorial practice question

Reasoned teacher answer

MAIN LESSON · SECTION 4

Run the supplied composition-card investigation

> Keep current spatial checks separate from earlier provenance review.

Current investigation and answer guidance

Prompt cards: A adds bottles-left/beaker-right; B adds bottles→beaker flow; C specifies exactly two bottles. Original counts and labels pass, while position and semantic flow fail. Moving bottles alone fixes position but not flow. The full proposed repair changes arrow endpoints; no actual revised generator result is supplied. Keep native reconstructions distinct from original outputs and verify chemistry separately.

In the selected independent task, star count and the above relation pass; the circle crossing the rectangle edge fails full containment.

Predict, sketch and inspect

1. Predict → Test → Record → Explain
2. Keep expected and actual results separate. Surprises are useful data when recorded honestly.
3. Use the supplied A/B/C prompt cards. Repair position, semantic arrow endpoints and exact count respectively, preserving other stated conditions. Sketch expected results and peer-check the composition criteria. No actual image generation or improved model result is supplied.
4. What did the hardest test teach you that the normal test did not?

Keep an evidence record

Record	What to capture
Input or evidence	Exact data, instruction or claim
Expected result	Answer or safe fallback declared before the run
Observed result	Actual result, including errors
Explanation	Rule, calculation or evidence explaining the outcome
Next test	One justified change and a new prediction

Current misconception support

Current misconceptions: every object present means pass—inspect relations; a rightward arrow is always correct—check semantic endpoints; moving an object automatically fixes its arrow—recheck flow; a paper repair is measured model improvement—label unrun proposals and actual observations separately.

Choose accessible support

What the response shows	Next teaching action
Missing or misread facts	Read the case aloud, mark supplied versus unknown facts, and let the learner restate it.
Wrong procedure	Return to the deciding step in the worked case. Contrast it with the proposed incorrect explanation.
Arithmetic or implementation error	Trace intermediate values or lines; preserve the first mismatch and retry that step.
Correct result without a reason	Ask for a trace and a changed case before marking independent understanding.
An unsupported wider claim	Ask which supplied evidence supports the claim and which further observation would be needed.

Offer an oral explanation, drawing, enlarged visual or fewer examples when that removes a reading/writing barrier. Keep the same reasoning goal.

Stretch secure learners by changing a boundary or assumption and asking them to defend the effect, not simply by assigning more of the same questions.

▼ Earlier wording, alternatives and picture transcripts

Run the weekly evidence lab

Words You Can Use to Reason

A definition matters when you can recognize the idea, use it, and contrast it with a near-miss.

Make the lab runnable

Use the supplied investigation for shared practice. Keep predictions and observed paper-trace results separate. Reserve Audit a new spatial description independently for the individual first attempt before feedback; do not use the reserved case as a paired lab task.

Diagnose and reteach

For guessing, return to given facts and request a trace. For vocabulary without application, use one example and one non-example. For arithmetic errors, check the setup before the calculation.

Finish with a different uncoached case before recording mastery.

Address these additional misconceptions

The worked result establishes every future case: **Provenance** tracks production history; it does not prove the content is accurate or establish every legal permission.

A missing **input** may be replaced without recording the change: A replacement changes the **evidence** or contract. Record the change and its justification; do not silently turn unknown into a measured value.

Repeating an assessed case is new independent **evidence**: A replay checks consistency. An example used for feedback or revision cannot later be described as untouched final evaluation.

Match the support to the first error

MAIN LESSON · SECTION 5

Assess the selected stars-and-containment description

> Reveal this key after the first attempt; old provenance questions are review.

Selected independent question and checked key

Selected case: A supplied drawing description says three stars are above a triangle, while a circle crosses the edge of a rectangle. The brief requires three stars above the triangle and the circle fully inside the rectangle.

Evaluate this description.

The supplied star count and above relation pass. Full containment fails because the circle crosses the rectangle edge. Check spatial relations as well as object presence.

This evaluates the supplied description, not an unseen image.

Judge reasoning and scope

Dimension	Evidence required
Explanation	Names the applicable idea or procedure and ties it to the supplied facts.
Trace and result	Preserves the given inputs and shows the relevant intermediate steps; distinguishes a prediction from an observed execution.
Limits	States the assumptions, missing evidence or conditions under which the result would change.

Record each dimension as not yet, with support, or independent. Accept a valid alternative procedure with a defensible trace.

Do not penalise an honestly recorded model failure if the learner correctly explains its **evidence** and limits.

Give one repair action

Name the earliest unsupported step and give one action to repair it. Have the learner make that repair now and explain why. Then assess the relevant skill on a fresh, fully specified case.

Confirm it was not previously practised with feedback; solve and check the new case before assigning it. A follow-up design prompt is a starting brief, not automatically an equivalent test.

Current workbook guidance

Current W1: name count,labels,position and semantic flow. W2: original count/labels pass,position/flow fail; changed positionpasses,flowstillfails. W3: object presence is insufficient for the specified relationship. W5: accept a complete one-relation change with explicit expected criterion results and no invented model observation. Keep the selected stars/containment assessment separate.

▼ Review · Earlier provenance questions and keys

W1 Explain the mechanism

Explain the weekly **mechanism** in your own words. Use the worked scenario to name its **input**, decision rule and **output**.

Teacher explanation: An image generator constructs an **output** from learned patterns and a specification. A generated picture is not a record that the depicted event occurred.

Keep a **provenance** record containing specification, tool/version when known, generation date, edits, permissions and intended use. Label fictional imagery.

Inspect visual requirements and avoid inferring identity or event authenticity from appearance.

W2 Trace the worked case

A fictional poster requires exactly three labelled circles. Generated image shows four circles and one unreadable label. A caption calls it a photograph of a real lesson.

Show the intermediate steps and give the conclusion with its scope.

Teacher explanation: It fails count and label criteria; the photograph claim is unsupported. Record it as a generated fictional illustration and revise or reject before use.

W3 Audit the limit

A report omits this qualification: **Provenance** tracks production history; it does not prove the content is accurate or establish every legal permission.

Explain how omitting it could change a reader's interpretation, and write an accurate replacement.

Teacher explanation: **Provenance** tracks production history; it does not prove the content is accurate or establish every legal permission.

State the observed result separately from the unverified or out-of-scope claim; preserve the original **evidence** rather than inventing a missing fact.

W4 Apply a new case independently

A generated diagram requires two arrows and labels **input**/**output**. It has two arrows but swapped labels. Metadata records generation, yet the caption says experimental **observation**. Audit.

Teacher explanation: Arrow count passes; label semantics fail. Metadata supports generation **provenance**, not observed-event authenticity; replace the caption and correct labels.

W5 Design a revealing follow-up

For the worked scenario, propose one additional case that could reveal a failure, describe its expected outcome before running it, and explain what would need to remain fixed for a fair comparison.

Do not reuse W4 as a new final test after receiving feedback.

Teacher explanation: Accept a concrete variant of the worked **input** or a missing/conflicting/boundary condition, with an expectation derived from the declared procedure.

Require preserved **setting**s, original **output**s and data roles. **Provenance** tracks production history; it does not prove the content is accurate or establish every legal permission.

The new case should test this particular **mechanism** rather than merely restate the original result.

▼ Earlier wording, alternatives and picture transcripts

Assess and explain the answers

Worked case answer

Check **subject**s, relative size, positions and sky separately. The position violates composition even if **subject**s exist.

Additional transfer practice question

A poster puts pale yellow labels on white and hides the main object behind decorations. Suggest two revisions and how to check them.

Reasoned practice answer

Increase text contrast and make the main object larger or less obstructed. Check readability and hierarchy at the size learners will actually view.

What counts as evidence

Criterion	0 points	1 point	2 points
Result	Incorrect or absent	Partly correct	Correct with necessary conditions
Reasoning	No supporting trace	Some steps	Clear mechanism, calculation or source support
Limit	Overclaims certainty	Vague limitation	Relevant uncertainty or missing fact
Transfer	Copies without adapting	Adapts with prompts	Solves a changed case independently

Use 6/8 as a classroom checkpoint, with 2 required for both Result and Reasoning. This is a proposed teaching rule, not a validated certification threshold.

Do not count a coached answer as independent mastery; correct unsafe or unsupported claims regardless of total.

Feedback

Ask the learner to find the **evidence** that challenges this claim: “Adding more decoration automatically improves visual communication.” Keep the first attempt and an uncoached retry separate.

Original transfer answer

Verify count=2 trees and the bench's horizontal position lies between the trees, with the sun in the agreed upper-right region. Presence alone passes an incomplete rubric.

Use labelled coordinates or a simple layout sketch to make the relation checkable.

Explanations for the additional workbook examples

Assess independent transfer

Selected case answer

Feedback that the learner uses

Connect, adapt and return

> Retain the project evidence and revisit the reasoning on a changed case.

Project evidence to keep

Create age-fit explanatory visuals with labeled purpose and no invented documentary **evidence**.

Keep the decision, **input**, result, explanation and remaining limitation in the project **evidence** record. Retrieve this record next week rather than restarting the project.

Create Study Buddy diagram rubrics covering counts, readable labels, containment, order and meaningful arrow direction.

Support while preserving the reasoning goal

Provide one short approved passage; separate instruction, **input**, **output** and **evidence**. Stretch: introduce an unsupported claim or conflicting source and validate claim by claim with a fallback.

Provide an **input**/procedure/result/limit frame and a calculator when needed. Ask students to identify the first step before completing the whole trace.

Extension: compare two concrete variants of this **mechanism** while holding unrelated conditions fixed; report both successful and unsuccessful outcomes.

Selected independent task: the supplied three-star count and above-triangle relation pass; the circle crossing the rectangle edge violates full containment. Evaluate the description, not an unseen image. Fresh retry: two books are below a shelf while a cup overlaps a tray edge; the brief requires two books above the shelf and the cup fully inside the tray. Count passes; both position and containment fail. Record support and collect the first attempt before feedback. The earlier two-arrow **provenance** task remains additional practice.

Plan the delayed check

Suggested return points in this level: ai-3/12, ai-3/14, ai-3/17. Use actual classroom dates, adjusting for holidays and gaps. One, three and six teaching weeks are scheduling choices, not a claimed optimal spacing.

At a delayed check, ask for the idea from memory and a changed application. Compare with the earlier independent response and record support used.

For a new level, revisit the previous capstone before checking the new prerequisites.

Record	Teacher evidence
Learner code and date	
Concept and case used; prior exposure	
Explanation / trace / limits	
Support and first repair	
Changed case and delayed outcome	
Next teaching action	

Use the **evidence** to choose reteaching or the next step. A completed page, confidence rating or attractive project does not by itself demonstrate understanding.

Bridge to next week

Ask for one decision the learner can now justify and one situation requiring more **evidence** or human review. Confidence ratings are separate from correct independent performance.

Next: Week 12: Speech and Audio Systems. Retrieve today's **evidence** and identify what carries forward and what is new.

Next is Week12: Speech and Audio Systems. Carry forward stage-specific **evidence** and the distinction between a representation, a reconstruction and an original observation.

Preparation and schedule

Teaching target: Explain the **mechanism** and terminology of image generation and **provenance**

Prepare the labelled worked-case picture, the matching workbook, fictional **input** cards and a place for individual responses. No paid AI account is required for the paper reasoning activities.

Session · Plan · Resources

> **Session:** Session 1 · Understand · 45 min
>
> **Plan:** 0–7: recall and prerequisite; 7–15: inspect the concrete case and predict; 15–30: teacher models the worked trace; 30–40: learners explain a step using the text and visual; 40–45: check the core idea.
>
> **Resources:** Sections 1–6; record the brief recall in the workbook.

> **Session:** Session 2 · Practise · 45 min

> **Plan:** 0–5: retrieve the procedure; 5–15: W2 completion practice; 15–23: explain and check with a partner; 23–30: each learner answers the misconception check; 30–40: targeted reteaching or a harder variation; 40–45: prepare the investigation.
>
> **Resources:** Sections 7–10; use the matching workbook W2 and misconception check.

> **Session:** Session 3 · Investigate and transfer · 45 min
>
> **Plan:** 0–5: retrieve the decision rule; 5–20: investigate or trace; 20–30: start the independent case; 30–38: connect the project; 38–43: act on feedback; 43–45: plan the return check.
>
> **Resources:** Use “Run the investigation”, “Connect your project”, “Show what you know”, “Study a complete case” and “Try a new case independently”. Give extra time for the full task set. If this week has a coding lab, use its named section; section numbers can change when extra explanations are included.

Practice and assessment reminders

Before class, solve the supported practice: A fictional poster requires exactly three labelled circles. Generated image shows four circles and one unreadable label. A caption calls it a photograph of a real lesson.

Show the intermediate steps and give the conclusion with its scope.

Reasoned practice answer: Teacher explanation: It fails count and label criteria; the photograph claim is unsupported. Record it as a generated fictional illustration and revise or reject before use.

Check every learner before discussion: Use the worked case for Image generation and **provenance**. Proposed explanation: “The worked result establishes every future case”. Decide whether this explanation is supported.

Point to the step or supplied fact that decides; explain your repair if needed.

Misconception repair: **Provenance** tracks production history; it does not prove the content is accurate or establish every legal permission.

Support: read the exact case aloud, enlarge the labelled picture, supply **input** cards and model only the first deciding step. Accept a spoken explanation or drawing; retain the reasoning goal.

Extension: Move bottles left of the beaker but keep the arrow pointing from beaker toward bottles. Require a **prediction** and a reason before comparing. Expected result: Position now passes; arrow direction still fails.

Reason: Changing object placement does not automatically reverse an arrow's semantic source and destination.

Independent assessment: withhold the reserved answer until the learner has attempted the new case. Record support separately from correctness.

Criterion	Not yet	With support	Independent
Explanation	Names an answer without a deciding fact	Uses a hint to link fact and decision	Explains the deciding fact in own words
Trace or test	Cannot connect input and result	Completes steps with prompts	Traces or tests a changed case accurately
Limits and revision	Claims more than evidence supports	Names a limit after a prompt	States a defensible limit and useful next test

Project checkpoint: Make a transparent first version. Keep a trace of how one **input** becomes an **output**; explain the rule or learned component.

Use the weekly teacher answer for topic-specific reasoning. A saved progress tick is an activity record; judge mastery from the learner's explanation and **evidence**.

Reference: feedback and records

> Use digital tools where they help retain an explanation and its evidence.

Keep practice and independent evidence separate

Use the two formative questions as supported practice, not as independent mastery scores. Discuss the deciding **evidence** rather than accepting a guessed selection.

The feedback comes from the reviewed public worked case. Do not reveal the separately reserved independent teacher answer until the learner has attempted that case.

Repair and portfolio records

Use the earlier worked-explanation links to address a specific missing building block, then return to the current question. Adapt this suggestion after observing the learner; it is not an automatic diagnosis.

Collect the completed-work portfolio as **evidence**. Record support separately from correctness, and assess explanation, trace/test and limitations. Progress ticks and quiz selections alone do not establish mastery.

▼ Earlier wording, alternatives and picture transcripts

This week has no code block. Use this routine when a later lesson includes an executable lab.

Ask students to predict before running code. Preserve errors and actual **output**s; collect a changed test and an explanation. The branch-boundary and indexing lessons deliberately include failure cases.

REFERENCE · SECTION 9

Reference: teach with the six pictures

> Choose the picture for the teaching move and connect it to the explanation.

01. Visual Composition: the case

Follow the labelled picture with the matching explanation. Open the vector diagram

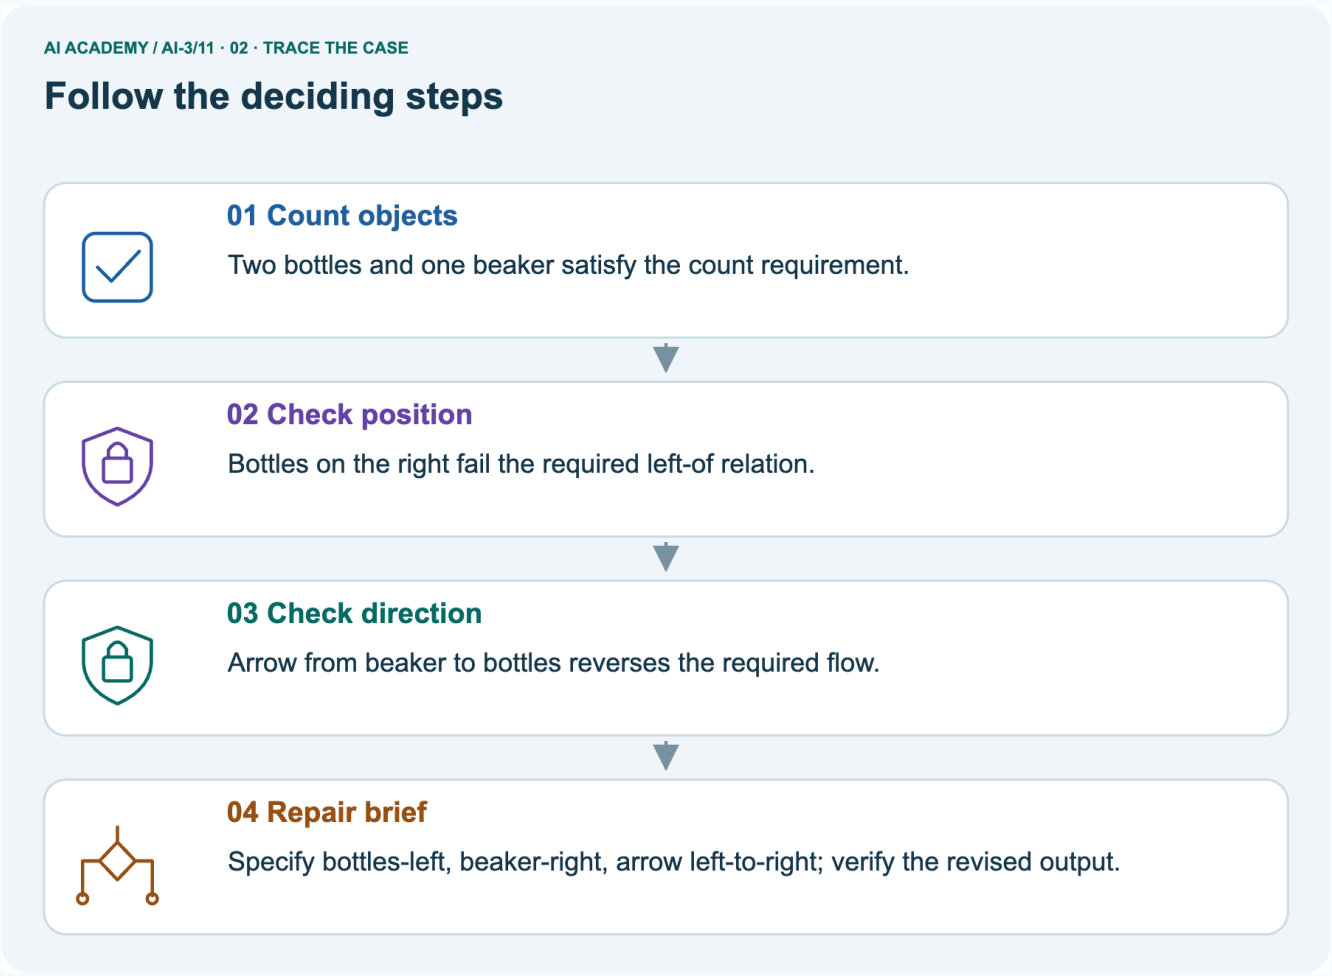

A fictional Study Buddy requests a science-poster layout, then audits a supplied drawing description. Supplied facts: Brief: exactly two labelled bottles left of one beaker; one arrow from bottles toward beaker.

Supplied drawing description: two labelled bottles are right of a beaker; an arrow points from beaker toward bottles.

Point to the given fact that matters most. Explain why it matters.

Teacher prompt: Point to the given fact that matters most. Explain why it matters. Ask learners to describe one label or arrow in ordinary words. Use the adjacent transcript if the image is difficult to see.

02. Follow the deciding steps

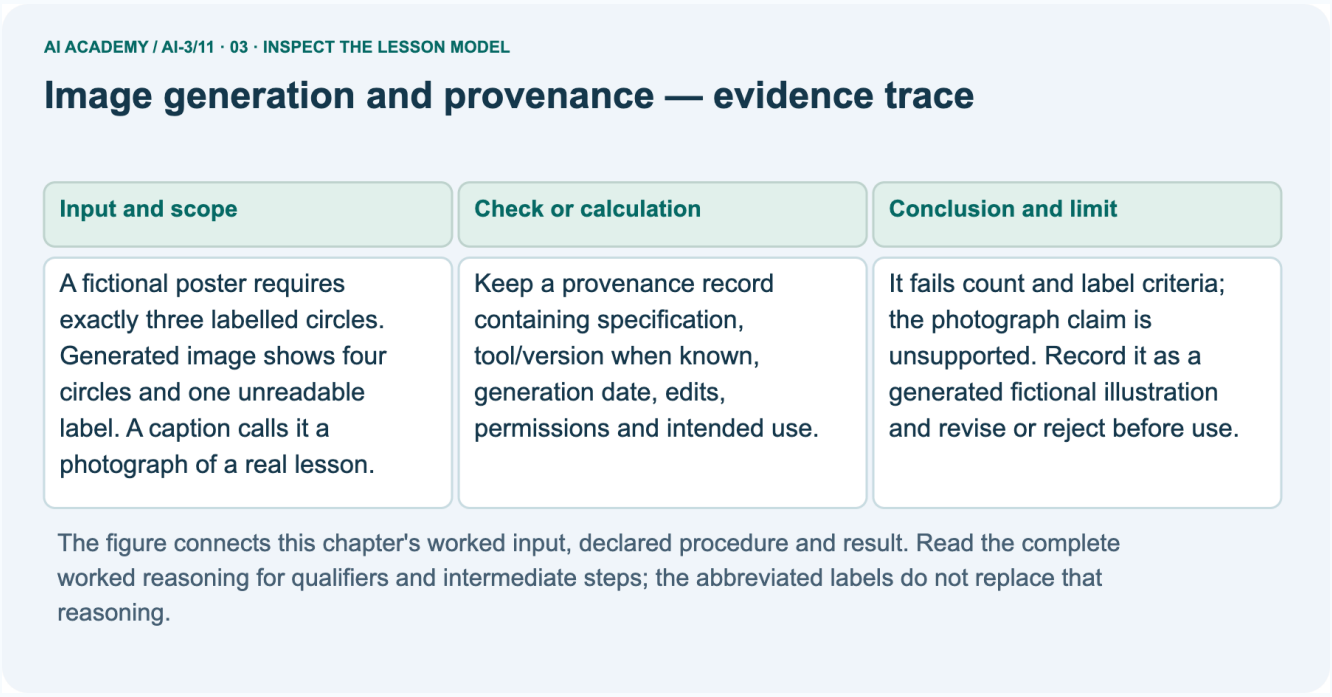

Follow the labelled picture with the matching explanation. Open the vector diagram

Count objects: Two bottles and one beaker satisfy the count requirement. → Check position: Bottles on the right fail the required left-of relation. → Check direction: Arrow from beaker to bottles reverses the required flow. → Repair brief: Specify bottles-left, beaker-right, arrow left-to-right; verify the revised **output**.

Point to each numbered stage and explain which recorded **input** it uses.

Teacher prompt: Point to each numbered stage and explain which recorded **input** it uses. Ask learners to describe one label or arrow in ordinary words. Use the adjacent transcript if the image is difficult to see.

03. Image generation and provenance — evidence trace

Follow the labelled picture with the matching explanation. Open the vector diagram

Image generation and **provenance** — **evidence** trace. A fictional poster requires exactly three labelled circles. Generated image shows four circles and one unreadable label.

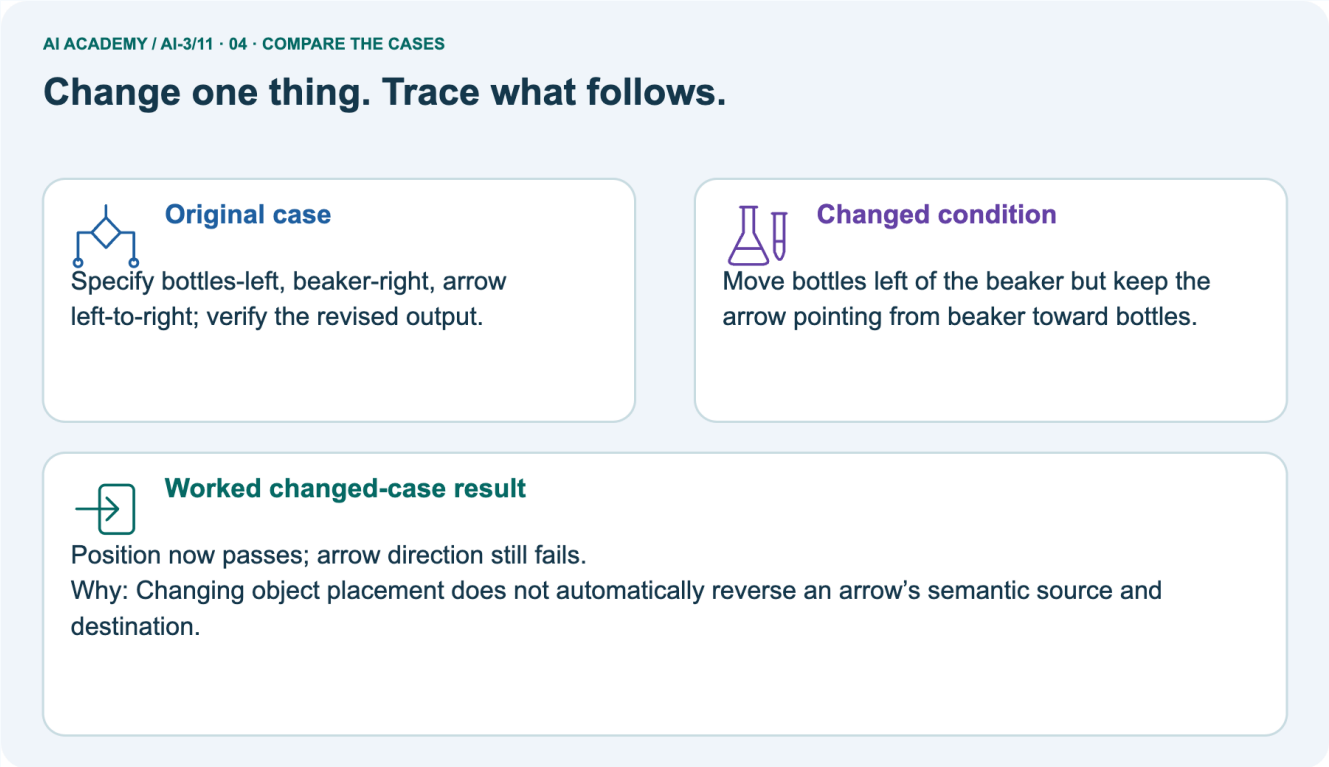

A caption calls it a photograph of a real lesson. | Keep a **provenance** record containing specification, tool/version when known, generation date, edits, permissions and intended use. | It fails count and label criteria; the photograph claim is unsupported.

Record it as a generated fictional illustration and revise or reject before use.

Read the labels and values. Explain the **relationship** the model shows.

Teacher prompt: Read the labels and values. Explain the **relationship** the model shows. Ask learners to describe one label or arrow in ordinary words. Use the adjacent transcript if the image is difficult to see.

04. Change one thing. Trace what follows.

Follow the labelled picture with the matching explanation. Open the vector diagram

Original case: Specify bottles-left, beaker-right, arrow left-to-right; verify the revised **output**. Changed condition: Move bottles left of the beaker but keep the arrow pointing from beaker toward bottles.

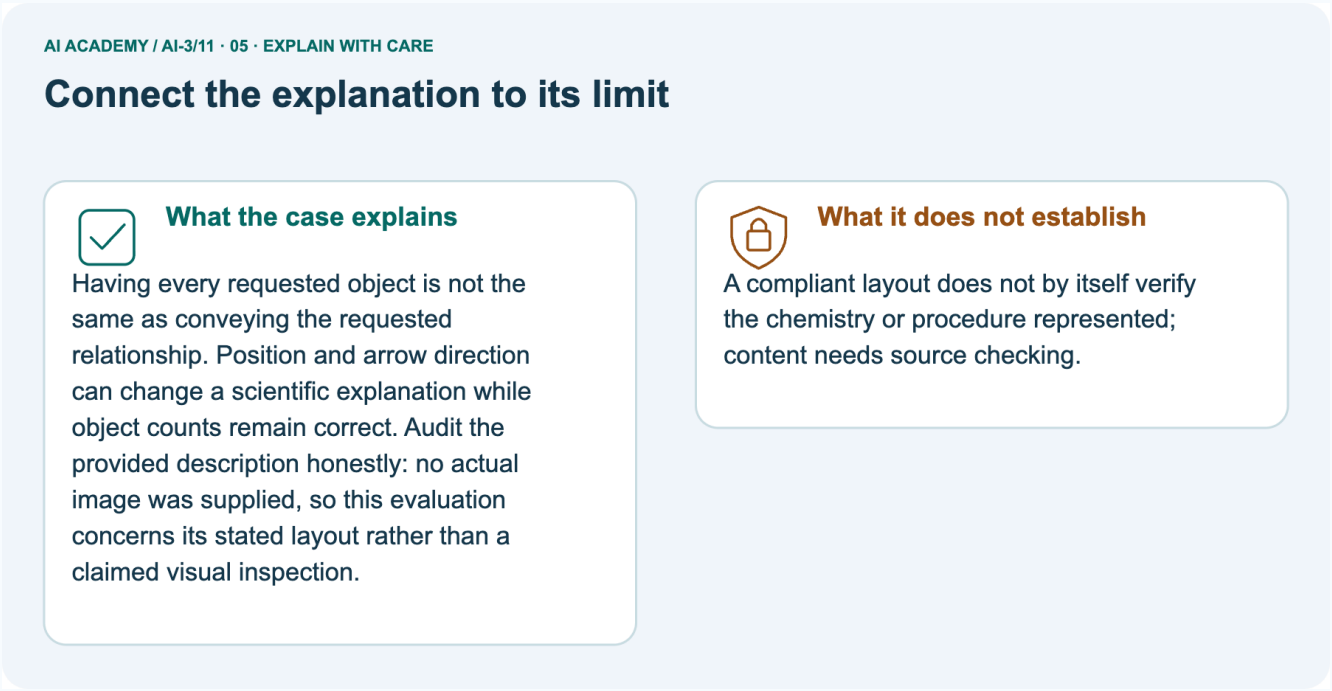

Expected result: Position now passes; arrow direction still fails. Reason: Changing object placement does not automatically reverse an arrow's semantic source and destination.

Predict before checking the worked changed-case result. Name what changed and what the supplied facts allow you to conclude.

Teacher prompt: Predict before checking the worked changed-case result. Name what changed and what the supplied facts allow you to conclude. Ask learners to describe one label or arrow in ordinary words.

Use the adjacent transcript if the image is difficult to see. Changed-case reasoning: Changing object placement does not automatically reverse an arrow's semantic source and destination.

05. Connect the explanation to its limit

Follow the labelled picture with the matching explanation. Open the vector diagram

Having every requested object is not the same as conveying the requested **relationship**. Position and arrow direction can change a scientific explanation while object counts remain correct.

Audit the provided description honestly: no actual image was supplied, so this evaluation concerns its stated layout rather than a claimed visual inspection.

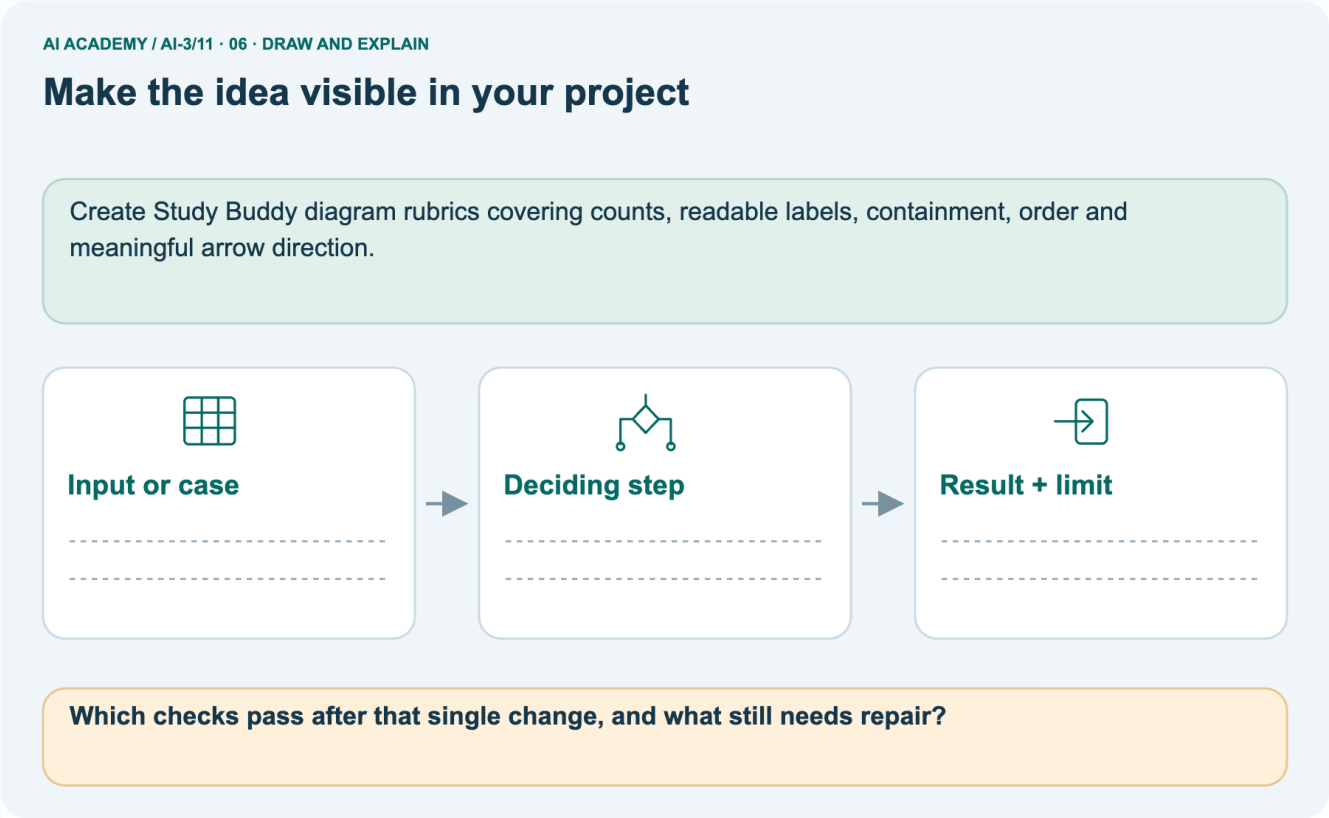

Limit: A compliant layout does not by itself verify the chemistry or procedure represented; content needs source checking.

Explain the case, then point to a limit on the claim.

Teacher prompt: Explain the case, then point to a limit on the claim. Ask learners to describe one label or arrow in ordinary words. Use the adjacent transcript if the image is difficult to see.

Keep the stated scope: A compliant layout does not by itself verify the chemistry or procedure represented; content needs source checking.

06. Make the idea visible in your project

Follow the labelled picture with the matching explanation. Open the vector diagram

Create Study Buddy diagram rubrics covering counts, readable labels, containment, order and meaningful arrow direction. Draw your **input**, deciding step, result and limit.

Supported question: Which checks pass after that single change, and what still needs repair?

Draw your project trace and justify the deciding step using **evidence**.

Teacher prompt: Draw your project trace and justify the deciding step using **evidence**. Ask learners to describe one label or arrow in ordinary words. Use the adjacent transcript if the image is difficult to see.

Supported practice key: Counts and left-of position pass. Direction still fails: arrow must originate at bottles and point toward beaker.

▼ Earlier wording, alternatives and picture transcripts

Use one picture at a time. Hide a worked result before asking for a **prediction**, then reveal it for feedback. These are supported teaching cases; retain the separate independent assessment for a fresh first attempt.
