

Scores and Calibration Intuition

Project: Responsible Plant Classifier

1. Recall and choose your starting point

Try the recall before opening notes. Then use a different colour or a labelled second line to correct your explanation.

Train a Classifier

Without opening the old lesson, explain one key idea from Train a Classifier. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

Decision Trees

Without opening the old lesson, explain one key idea from Decision Trees. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

Leakage

Without opening the old lesson, explain one key idea from Leakage. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

2. Practise with fading help

Use W2: Locate the discrepancy for Calibration as a group property. Record the answer once; the lesson and workbook refer to the same attempt.

Given inputs · Procedure I chose · Middle steps · Result and check

Given inputs: _____

Procedure I chose: _____

Middle steps: _____

Result and check: _____

The step I completed without help, and the hint I needed

3. Individual reasoning check

Use the worked case for Calibration as a group property. Proposed explanation: “A final answer is enough”. Decide whether this explanation is supported. Point to the step or supplied fact that decides; explain your repair if needed.

My explanation before partner discussion

4. Independent transfer case

Independent case: Apply independently

Twenty cases all predict .3 with eight positives; ten all predict .7 with seven positives. Give plot points and interpret.

My independent explanation, trace and limits

Attempt this case before feedback. Record any help. Earlier examples below are further practice; a case already practised with feedback cannot establish fresh transfer.

5. Your learning target

Twenty cases receive score .7 and fourteen are correct. Explain what the observed rate suggests and what it does not establish about another score group.

6. Solve the given case

Ten cases receive probability .8 for spotted; eight are spotted.

Interpret calibration and its limits.

Show your trace, calculation or evidence

Write or draw your reasoning and evidence.

7. Check a changed case

Among 20 predictions with score 0.8, 12 are correct. What is observed accuracy in this group and how does it compare with 0.8?

My independent answer and reason

Write or draw your reasoning and evidence.

Week 14 Test and reflect

8. Design a revealing test

Create a changed input, boundary case or missing-information case. Write the expected answer or safe response before testing.

Test record · My evidence

Test record: Changed input or condition

My evidence: _____

Test record: Expected answer or fallback

My evidence: _____

Test record: Observed result

My evidence: _____

Test record: Why the result occurred

My evidence: _____

9. Project checkpoint

Add an uncertainty band to the Plant Classifier and define what the interface says when scores fall inside it.

The project change and evidence I will keep

Write or draw your reasoning and evidence.

10. Self check

I can explain the mechanism. I can show evidence. I can handle a changed case. I can name a limit. Mark each as not yet, with help or independently, and attach supporting work.

Teacher review _____ Next step _____

11. Transfer practice from the original programme

Twenty cases receive score .7 and fourteen are correct. Explain what the observed rate suggests and what it does not establish about another score group.

My independently reasoned answer

Record support used: none, hint or teacher explanation.

12. W1 Compute frequencies

Give the observed frequencies for the two worked groups.

My reasoning and evidence

13. W2 Locate the discrepancy

Which worked group overstates positive frequency and by how much?

My reasoning and evidence

14. W3 Separate ranking

Why can constant .5 predictions look calibrated but rank poorly?

My reasoning and evidence

15. W4 Apply independently

Twenty cases all predict .3 with eight positives; ten all predict .7 with seven positives. Give plot points and interpret.

My reasoning and evidence

16. W5 Protect evaluation

What is wrong with calibrating and reporting success on the same final-test records?

My reasoning and evidence

17. Feedback, return check and learning record

Evidence · My record

Evidence: Worked alone / hint / model

My record: _____

Evidence: First step I repaired and why

My record: _____

Evidence: New case checked later; date and result

My record: _____

Evidence: What I can now explain without notes

My record: _____

Evidence: One remaining question

My record: _____

Revisit this idea with your teacher after a delay. Familiarity is different from explaining and using it on a changed case.

18. Pictorial case practice: Scores and Calibration Intuition

Treat calibration as a comparison across groups of probability scores.

Toy classifier outputs $p(\text{spotted})=0.8$ on ten cases; eight are actually spotted. Another ten have $p=0.2$; four are spotted.

All inputs and outcomes in this worked example are invented classroom data; no real model run is claimed.

Scores and Calibration Intuition

Start with the supplied facts

Follow each arrow. Ask which fact allows the next step.

1. Group scores

Keep the ten 0.8 cases and ten 0.2 cases separate.

2. Compare frequencies

Observed spotted fractions are $8/10=0.8$ and $4/10=0.4$.

3. Interpret gap

The 0.8 group matches here; the 0.2 group understates the observed fraction by 0.2.

CHANGE ONE THING

The 0.2 group has two spotted cases instead of four.

Explain the changed result using the matching lesson.

Does a calibrated 0.8 score mean every such leaf is spotted? Point to the relevant step in the picture, then write the changed result and the rule or evidence that supports it.

My picture-based explanation and changed-case prediction

Support used: alone / hint / worked example. This record is practice evidence.

Project connection: For your Responsible Plant Classifier, save the input, procedure, observed result and limitation of this check. Label this worked example as practice; use a different, previously unreviewed case when checking independent understanding.
