

Forward passes by hand

Project: Image-pattern Network Investigation

1. Recall and choose your starting point

Try the recall before opening notes. Then use a different colour or a labelled second line to correct your explanation.

Composing layers

Without opening the old lesson, explain one key idea from Composing layers. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

Bias terms and decision boundaries

Without opening the old lesson, explain one key idea from Bias terms and decision boundaries. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

2. Practise with fading help

Use W2: Locate a bias omission for Forward passes by hand. Record the answer once; the lesson and workbook refer to the same attempt.

Given inputs · Procedure I chose · Middle steps · Result and check

Given inputs: _____

Procedure I chose: _____

Middle steps: _____

Result and check: _____

The step I completed without help, and the hint I needed

3. Individual reasoning check

Use the worked case for Forward passes by hand. Proposed explanation: “ReLU means the output cannot be negative”. Decide whether this explanation is supported. Point to the step or supplied fact that decides; explain your repair if needed.

My explanation before partner discussion

4. Independent transfer case

Independent case: Audit a different network independently

Use $z_1 = x + 1$, $z_2 = 2 - 2x$, $h = \text{ReLU}(z)$ component by component, and $y = 2h_1 + h_2 - 3$. Trace $x = 0$ and $x = 2$. A submitted $x = 2$ trace uses $h = [3, -2]$ and $y = 1$. Find its first error and correct all later values.

My independent explanation, trace and limits

Attempt this case before feedback. Record any help. Earlier examples below are further practice; a case already practised with feedback cannot establish fresh transfer.

5. W1 Complete a fresh row

Trace $x = -1$ through the lesson network. Record z , h and y .

My reasoning and evidence

6. W2 Locate a bias omission

At $x = 3$ a trace gives $z = [5, -1]$, $h = [5, 0]$ and $y = 5$. Identify the first incorrect stage and repair it.

My reasoning and evidence

7. W3 Check both boundaries

Trace $x = 0.5$ and $x = 2$. Which hidden score is zero in each case?

My reasoning and evidence

8. W4 Audit a different network independently

Use $z_1 = x + 1$, $z_2 = 2 - 2x$, $h = \text{ReLU}(z)$ component by component, and $y = 2h_1 + h_2 - 3$. Trace $x = 0$ and $x = 2$. A submitted $x = 2$ trace uses $h = [3, -2]$ and $y = 1$. Find its first error and correct all later values.

My reasoning and evidence

9. W5 Limit a passing test

Explain why testing only $x = 1$ in the lesson model may miss a hidden-order swap.

My reasoning and evidence

10. Project checkpoint and reflection

Add a labelled forward passes by hand evidence sheet to Image-pattern Network Investigation. Show how you can record scores and activations in dependency order. Use the supplied fictional case and keep its inputs, intermediate steps, calculation or prediction, and limitation. Connect this record to last week's record; a matching answer without a trace is insufficient.

My project change, supporting evidence and remaining limit

11. Feedback, return check and learning record

Evidence · My record

Evidence: Worked alone / hint / model

My record: _____

Evidence: First step I repaired and why

My record: _____

Evidence: New case checked later; date and result

My record: _____

Evidence: What I can now explain without notes

My record: _____

Evidence: One remaining question

My record: _____

Revisit this idea with your teacher after a delay. Familiarity is different from explaining and using it on a changed case.

12. Pictorial case practice: Forward passes by hand

Audit a forward pass by writing every value at its correct stage.

Toy scalar network $z=2x-1$, $h=\text{ReLU}(z)$, $y=-h+4$. Trace $x=0$ and $x=2$.

All inputs and outcomes in this worked example are invented classroom data; no real model run is claimed.

Forward passes by hand

Start with the supplied facts

Follow each arrow. Ask which fact allows the next step.

1. Preactivation

At $x=0$, $z=-1$; at $x=2$, $z=3$.

2. Activation

At $x=0$, $h=0$; at $x=2$, $h=3$.

3. Output

Outputs are 4 and 1 respectively.

CHANGE ONE THING

A submitted $x = 0$ trace uses $h=-1$ and $y = 5$.

Explain the changed result using the matching lesson.

Why should feedback identify h before correcting only y ? Point to the relevant step in the picture, then write the changed result and the rule or evidence that supports it.

My picture-based explanation and changed-case prediction

Support used: alone / hint / worked example. This record is practice evidence.

Project connection: For your Image-pattern Network Investigation, save the input, procedure, observed result and limitation of this check. Label this worked example as practice; use a different, previously unreviewed case when checking independent understanding.
