

Batching and epochs

Project: Image-pattern Network Investigation

1. Recall and choose your starting point

Try the recall before opening notes. Then use a different colour or a labelled second line to correct your explanation.

Training a small network

Without opening the old lesson, explain one key idea from Training a small network. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

Gradients with a numerical check

Without opening the old lesson, explain one key idea from Gradients with a numerical check. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

Parameters and architecture

Without opening the old lesson, explain one key idea from Parameters and architecture. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

2. Practise with fading help

Use W2: Repair a stale gradient for Batching and epochs. Record the answer once; the lesson and workbook refer to the same attempt.

Given inputs · Procedure I chose · Middle steps · Result and check

Given inputs: _____

Procedure I chose: _____

Middle steps: _____

Result and check: _____

The step I completed without help, and the hint I needed

3. Individual reasoning check

Use the worked case for Batching and epochs. Proposed explanation: “One epoch always means one update”. Decide whether this explanation is supported. Point to the step or supplied fact that decides; explain your repair if needed.

My explanation before partner discussion

4. Independent transfer case

Independent case: Test order on a new case independently

Use $A = (1, 1)$, $B = (2, 0)$, $h = \text{ReLU}(x)$, $y = vh$, $v = 0$ and rate 0.1. Train with size 1 for one epoch in A then B order, then restart at 0 and reverse the order. Show gradients and parameter values. Compare the final values.

My independent explanation, trace and limits

Attempt this case before feedback. Record any help. Earlier examples below are further practice; a case already practised with feedback cannot establish fresh transfer.

5. W1 Count a partial batch

For 10 rows, batch size 4 and three epochs, retaining the final batch, list batch lengths and count total updates and example visits.

My reasoning and evidence

6. W2 Repair a stale gradient

For A then B separately in the lesson, a learner computes both gradients at $v = 0$, then applies them to get $v = 2$. Explain the error and give the correct final value.

My reasoning and evidence

7. W3 Combine unequal batches

At one frozen model, batches of sizes 3 and 1 have mean squared errors 2 and 10. Find the full MSE and explain why the average of 2 and 10 is wrong.

My reasoning and evidence

8. W4 Test order on a new case independently

Use $A = (1, 1)$, $B = (2, 0)$, $h = \text{ReLU}(x)$, $y = vh$, $v = 0$ and rate 0.1. Train with size 1 for one epoch in A then B order, then restart at 0 and reverse the order. Show gradients and parameter values. Compare the final values.

My reasoning and evidence

9. W5 Audit an epoch claim

A program processes 11 rows using size 4 and drops the last incomplete batch. How many examples did it visit and how many updates occurred? What must its report disclose?

My reasoning and evidence

10. Project checkpoint and reflection

Add a labelled batching and epochs evidence sheet to Image-pattern Network Investigation. Show how you can distinguish an example a batch an update and an epoch. Use the supplied fictional case and keep its inputs, intermediate steps, calculation or prediction, and limitation. Connect this record to last week's record; a matching answer without a trace is insufficient.

My project change, supporting evidence and remaining limit

11. Feedback, return check and learning record

Evidence · My record

Evidence: Worked alone / hint / model

My record: _____

Evidence: First step I repaired and why

My record: _____

Evidence: New case checked later; date and result

My record: _____

Evidence: What I can now explain without notes

My record: _____

Evidence: One remaining question

My record: _____

Revisit this idea with your teacher after a delay. Familiarity is different from explaining and using it on a changed case.

12. Pictorial case practice: Batching and epochs

Show why an epoch's example order can matter for single-example updates.

Toy $y=wx$, rate 0.1, squared loss, start $w = 0$. Training $A=(x = 1, \text{target } 2)$, $B=(x = 2, \text{target } 0)$.

All inputs and outcomes in this worked example are invented classroom data; no real model run is claimed.

Batching and epochs

Start with the supplied facts

Follow each arrow. Ask which fact allows the next step.

1. A then B

A gradient -4 gives $w = 0.4$; B gradient 3.2 then gives $w = 0.08$.

2. Restart and reverse

B at $w=0$ has gradient 0; A then gives $w = 0.4$.

3. Compare full batch

At $w = 0$ mean gradient $= (-4+0)/2 = -2$; one full-batch update gives $w = 0.2$.

CHANGE ONE THING

Use only one full-batch update after reversing record order.

Explain the changed result using the matching lesson.

Why do the single-example orders finish at different weights? Point to the relevant step in the picture, then write the changed result and the rule or evidence that supports it.

My picture-based explanation and changed-case prediction

Support used: alone / hint / worked example. This record is practice evidence.

Project connection: For your Image-pattern Network Investigation, save the input, procedure, observed result and limitation of this check. Label this worked example as practice; use a different, previously unreviewed case when checking independent understanding.
