

Debugging shapes and gradients

Project: Image-pattern Network Investigation

1. Recall and choose your starting point

Try the recall before opening notes. Then use a different colour or a labelled second line to correct your explanation.

Initialisation and reproducibility

Without opening the old lesson, explain one key idea from Initialisation and reproducibility. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

Training and validation curves

Without opening the old lesson, explain one key idea from Training and validation curves. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

Training a small network

Without opening the old lesson, explain one key idea from Training a small network. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

2. Practise with fading help

Use W2: Expose a hidden bias error for Debugging shapes and gradients. Record the answer once; the lesson and workbook refer to the same attempt.

Given inputs · Procedure I chose · Middle steps · Result and check

Given inputs: _____

Procedure I chose: _____

Middle steps: _____

Result and check: _____

The step I completed without help, and the hint I needed

3. Individual reasoning check

Use the worked case for Debugging shapes and gradients. Proposed explanation: “Matching output shape guarantees the computation”. Decide whether this explanation is supported. Point to the step or supplied fact that decides; explain your repair if needed.

My explanation before partner discussion

4. Independent transfer case

Independent case: Debug a new gradient independently

Use $y = 3a + c$, target 2, loss $(y - 2)^2$, at $[a, c] = [0, 1]$. A program returns gradient $[-2, -6]$ in order $[a, c]$. Use symmetric step 0.1 to check each coordinate, then update both with the corrected gradient and rate 0.05. Report new parameters and loss.

My independent explanation, trace and limits

Attempt this case before feedback. Record any help. Earlier examples below are further practice; a case already practised with feedback cannot establish fresh transfer.

5. W1 Reject a shape mismatch

The layer expects W shape 3 by 2, b length 3 and x length 2. A submitted x has length 3. Should the last feature be silently ignored? State the failed contract and repair process.

My reasoning and evidence

6. W2 Expose a hidden bias error

Compute scores and activations for $x = [3, 1]$ with the lesson layer, then omit the third bias. Identify the first discrepancy and the resulting activation error.

My reasoning and evidence

7. W3 Check an update sign

For the diagnostic model at $[1, 0]$, gradient $[-4, -2]$ and rate 0.05, calculate the correct new parameters and loss. Compare with adding the gradient step.

My reasoning and evidence

8. W4 Debug a new gradient independently

Use $y = 3a + c$, target 2, loss $(y - 2)^2$, at $[a, c] = [0, 1]$. A program returns gradient $[-2, -6]$ in order $[a, c]$. Use symmetric step 0.1 to check each coordinate, then update both with the corrected gradient and rate 0.05. Report new parameters and loss.

My reasoning and evidence

9. W5 Keep independent regression checks

A program passes only the $x = [1, 2]$ final-activation test. Propose one intermediate-value check, one malformed-input check and one additional input that exposes the bias omission.

My reasoning and evidence

10. Project checkpoint and reflection

Add a labelled debugging shapes and gradients evidence sheet to Image-pattern Network Investigation. Show how you can check dimension contracts before computing a layer. Use the supplied fictional case and keep its inputs, intermediate steps, calculation or prediction, and limitation. Connect this record to last week's record; a matching answer without a trace is insufficient.

My project change, supporting evidence and remaining limit

11. Feedback, return check and learning record

Evidence · My record

Evidence: Worked alone / hint / model

My record: _____

Evidence: First step I repaired and why

My record: _____

Evidence: New case checked later; date and result

My record: _____

Evidence: What I can now explain without notes

My record: _____

Evidence: One remaining question

My record: _____

Revisit this idea with your teacher after a delay. Familiarity is different from explaining and using it on a changed case.

12. Pictorial case practice: Debugging shapes and gradients

Catch a gradient -order bug before the optimiser changes parameters.

Toy $y=2a+3c$, target 4, start $[a, c]=[1, 0]$. Loss $(y-4)^2$. Program claims gradient $[-12, -8]$ in order $[a, c]$.

All inputs and outcomes in this worked example are invented classroom data; no real model run is claimed.

Debugging shapes and gradients

Start with the supplied facts

Follow each arrow. Ask which fact allows the next step.

1. Compute correct gradient

$y = 2$, residual -2 : gradient $[-8, -12]$, not $[-12, -8]$.

2. Check coordinates

Step 0.1: a losses 3.24, 4.84 give -8 ; c losses 2.89, 5.29 give -12 .

3. Apply correct update

At rate 0.01: new $[a, c] = [1.08, 0.12]$; $y = 2.52$, loss 2.1904.

CHANGE ONE THING

The program changes its declared order to $[c, a]$ and returns $[-12, -8]$.

Explain the changed result using the matching lesson.

What should a debugging record pair with every gradient value? Point to the relevant step in the picture, then write the changed result and the rule or evidence that supports it.

My picture-based explanation and changed-case prediction

Support used: alone / hint / worked example. This record is practice evidence.

Project connection: For your Image-pattern Network Investigation, save the input, procedure, observed result and limitation of this check. Label this worked example as practice; use a different, previously unreviewed case when checking independent understanding.
