

Reading structured data

Project: Python readiness portfolio

1. Recall and choose your starting point

Try the recall before opening notes. Then use a different colour or a labelled second line to correct your explanation.

Dictionaries and records

Without opening the old lesson, explain one key idea from Dictionaries and records. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

Functions and arguments

Without opening the old lesson, explain one key idea from Functions and arguments. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

Branching and boundary tests

Without opening the old lesson, explain one key idea from Branching and boundary tests. Give an example and a mistake that the idea helps you avoid.

My remembered idea, example and correction

2. Practise with fading help

Use W2: Trace all updates for Reading structured data. Record the answer once; the lesson and workbook refer to the same attempt.

Given inputs · Procedure I chose · Middle steps · Result and check

Given inputs: _____

Procedure I chose: _____

Middle steps: _____

Result and check: _____

The step I completed without help, and the hint I needed

3. Individual reasoning check

Use the worked case for Reading structured data. Proposed explanation: “A successful run proves the conclusion”. Decide whether this explanation is supported. Point to the step or supplied fact that decides; explain your repair if needed.

My explanation before partner discussion

4. Independent transfer case

Independent case: Preserve records and report measured coverage

Trace the named fields and missing-value policy. Predict the output, state the observed total and mean denominator, and report coverage. What changes if all three rows are empty records?

```
rows = [{"score": 2}, {"score": 6}, {}]  
values = []  
  
for row in rows:  
    value = row.get("score")  
    if value is not None:  
        values.append(value)  
  
observed_total = sum(values)  
  
if len(values) > 0:  
    mean = observed_total / len(values)  
  
else:  
    mean = None  
  
print(observed_total, len(values), len(rows), mean)
```

My independent explanation, trace and limits

Attempt this case before feedback. Record any help. Earlier examples below are further practice; a case already practised with feedback cannot establish fresh transfer.

5. W1 Read a row

In the worked dataset, state the number of records and the spare spaces in the second record.

My reasoning and evidence

6. W2 Trace all updates

For spare contributions 2, 4 and 1, trace total starting at 0.

My reasoning and evidence

7. W3 Repair initialization

A loop resets total to 0 on each pass over contributions 2, 4, 1. What final total appears and how should it be fixed?

My reasoning and evidence

8. W4 Process new records independently

Write a loop for records (capacity 9, used 2), (capacity 5, used 1), and (capacity 4, used 4). Predict the total. Reverse the order and test an empty list.

My reasoning and evidence

9. W5 Interpret an empty result

An empty dataset produces total 0. Can you conclude that every cupboard is full?

My reasoning and evidence

10. Project checkpoint and reflection

Add a labelled reading structured data evidence sheet to Python readiness portfolio. Show how you can process a list of records consistently. Use the supplied fictional case and keep its inputs, intermediate steps, calculation or prediction, and limitation. Connect this record to last week's record; a matching answer without a trace is insufficient.

My project change, supporting evidence and remaining limit

11. Feedback, return check and learning record

Evidence · My record

Evidence: Worked alone / hint / model

My record: _____

Evidence: First step I repaired and why

My record: _____

Evidence: New case checked later; date and result

My record: _____

Evidence: What I can now explain without notes

My record: _____

Evidence: One remaining question

My record: _____

Revisit this idea with your teacher after a delay. Familiarity is different from explaining and using it on a changed case.

12. Pictorial case practice: Reading structured data

Read rows with a missing-field policy. A toy table is represented as a list of dictionaries; count only rows with a recorded count.

Python 3 records: [{"count":2}, {"count":0}, {}]. Policy: include existing numeric counts, including zero; skip an absent field.

Included values and absent field

	Count value	Include in mean?
Row 1	2	Yes
Row 2	0	Yes
Row 3	Absent	No

Read a cell using both its row and column labels.

Reading structured data

Start with the supplied facts

Follow each arrow. Ask which fact allows the next step.

1. Inspect three rows

Two rows contain count; the third does not.

2. Accumulate values

The included values sum to $2+0=2$, with denominator 2.

3. Report coverage and mean

Mean is 1; measured coverage is 2 of 3 rows.

CHANGE ONE THING

Add `{"count":4}` as a fourth row.

Explain the changed result using the matching lesson.

Circle the included rows, calculate the sum and mean, and state coverage. Repeat after adding the fourth row with count four.

My picture-based explanation and changed-case prediction

Support used: alone / hint / worked example. This record is practice evidence.

Project connection: For Python readiness before the Responsible Plant Classifier, retain a trace of the values, the predicted outputs and the changed-case explanation. Use actual Python 3 results to check the prediction after reasoning first.
