

Categories and Labels

Project: Helpful Classroom Sorter

1. Your mission

Your learning target

I can apply a category definition using explicit evidence and boundary rules.

I can distinguish a known failure from information that is missing or unreadable.

I can use disagreement to improve a labelling guide without mistaking agreement for truth.

Remember before reading

Close your notes first. A rough first answer helps us choose the right starting point; it is not a score for your ability.

Without opening the old lesson, explain one key idea from Sound Becomes a Signal. Give an example and a mistake that the idea helps you avoid.

Without opening the old lesson, explain one key idea from Rules or Learned Patterns?. Give an example and a mistake that the idea helps you avoid.

Without opening the old lesson, explain one key idea from AI or Not?. Give an example and a mistake that the idea helps you avoid.

After trying, check the relevant lesson or ask your teacher. Change the part of your explanation that the evidence shows was wrong.

Labels are human choices that may overlap or be unclear.

LEARNING TARGET Your dataset labels 'reusable containers'. One team includes a disposable bottle reused once; another excludes it. Give an operational label rule and classify this boundary case under that rule. Explain why a different rule could be defensible.

Learner name:

Readiness for the connected explanation

A transcript leaves out an unclear word. Why should a later system not simply treat that missing word as a known value?

This week's end goal

By the end, I can apply a shared labelling policy consistently, including missing information.

2. Notice the evidence

PICTURE STORY

Look Closely Before You Explain

Pictures give clues; evidence tells us what the clues mean.

MYSTERY A playground object can be both red and round, a toy and sports equipment, or safe in one situation and unsafe in another.

What do you notice?

Name three visible details without explaining them yet.

Circle the detail most connected to the system's decision.

Name one detail that may be decoration or distraction.

Make a first prediction and state the clue that supports it.

My observations, prediction, and evidence:

GOOD THINKING A prediction can change when stronger evidence appears.

A closer explanation

Two students are sorting fictional event cards for a classroom calendar. Their first instruction is Put the good cards together. Mina calls a colourful card good. Theo calls a plain card good because its room is easy to read. They disagree even though both followed a reasonable interpretation of the word good.

A category is useful for a task when people can tell what evidence makes an example belong to it. An operational definition states the observations or checks to perform. For this paper exercise, we will check two printed fields: an event day and a room code. The task is to check the record against a classroom policy, not to judge the quality of the event or the person who wrote it.

Labels depend on the definition in use. A model fitted to labels can learn the distinctions those labels encode, including mistakes and inconsistencies. Before asking a model to copy a label, ask whether

people have a clear, useful guide for assigning it.

3. See how it works

VISUAL MECHANISM

Input → **Process** → **Output**

Follow the information instead of imagining magic inside the machine.

INPUT

objects and a purpose for sorting

PROCESS

people define labels and assign examples

OUTPUT

category names attached to items

INPUT objects and a purpose for sorting

PROCESS people define labels and assign examples

OUTPUT category names attached to items

CORE IDEA Labels are human choices that may overlap or be unclear.

UNDER THE HOOD A label is an operational definition chosen for a task. Categories may be mutually exclusive, multi-label, hierarchical, subjective, or context-dependent. Ambiguity in labels becomes ambiguity in training and evaluation.

Draw a fresh example with all three stages:

A closer explanation

Our fictional calendar accepts a whole-number day from 1 through 30, including both endpoints, and exactly one room code, A or B. The month is already fixed for this exercise. A blank or unreadable field counts as unknown. The categories are revise, review and ready. Use the checks in the order shown.

Three ordered checks for a calendar card

Check in this order · Evidence · Recorded label

Check in this order: First check known values

Evidence: Any known field fails its criterion

Recorded label: Revise even if another field is unknown

Check in this order: Then check missing information

Evidence: No known failure but a field is blank or unreadable

Recorded label: Review because evidence is incomplete

Check in this order: Otherwise all checks have passed

Evidence: Day is 1 through 30 and room is A or B

Recorded label: Ready under this record policy

Stop at the first matching row. The order resolves a card with both a known failure and an unknown field. Ready describes the printed record under this policy; it does not confirm that the event exists or has permission to run.

Known failure and unknown are different. Day 31 is known and outside the accepted range, so the card needs revision. An unreadable day might be valid or invalid; without another known failure, it needs review. Never silently turn a blank into zero just to make a comparison possible.

Connect the picture and the explanation

Point to the input, the deciding step and the result in this week's visual. Explain the same step in ordinary words. A picture helps when you can say what each part represents.

4. Compare the cases

PICTURE GALLERY

Four Cases, Four Clues

Use the visual cue, then read the evidence carefully.

Red ball

Frisbee

Wet slide

Mystery object

CASE 1 — Red ball Clue: red and round. Meaning: multiple descriptive labels.

CASE 2 — Frisbee Clue: toy or sports equipment. Meaning: purpose changes label.

CASE 3 — Wet slide Clue: equipment and possible hazard. Meaning: context matters.

CASE 4 — Mystery object Clue: insufficient features. Meaning: need more information.

BOUNDARY Labels do not exist naturally in the data; people define them for a purpose.

Which two pictures are easiest to confuse? What evidence separates them?

Change one thing in the pictured case

Change: Change B's quantity from 5 to 4; leave colour blank.

Prediction: B becomes review.

Reason: The known failure is removed, but a required field is still missing.

5. Words that unlock the idea

VOCABULARY

Words You Can See and Use

The badge is a memory cue; the definition does the real thinking work.

label

overlap

ambiguity

Word · Meaning · My example

Word: category

Meaning: group created for a purpose

My example: _____

Word: label

Meaning: name assigned to an example

My example: _____

Word: overlap

Meaning: when more than one label can fit

My example: _____

Word: ambiguity

Meaning: when evidence allows multiple reasonable meanings

My example: _____

Misconception detective

CLAIM TO REPAIR Every object has exactly one correct label.

Use one vocabulary word and one piece of evidence to repair it:

WORD POWER A strong definition helps you decide something in a new case.

Words used in the closer explanation

Word · Meaning

Word: Operational definition

Meaning: A definition precise enough to tell someone what to observe or do when assigning a category

Word: Annotator

Meaning: A person who assigns labels to examples

Word: Disagreement

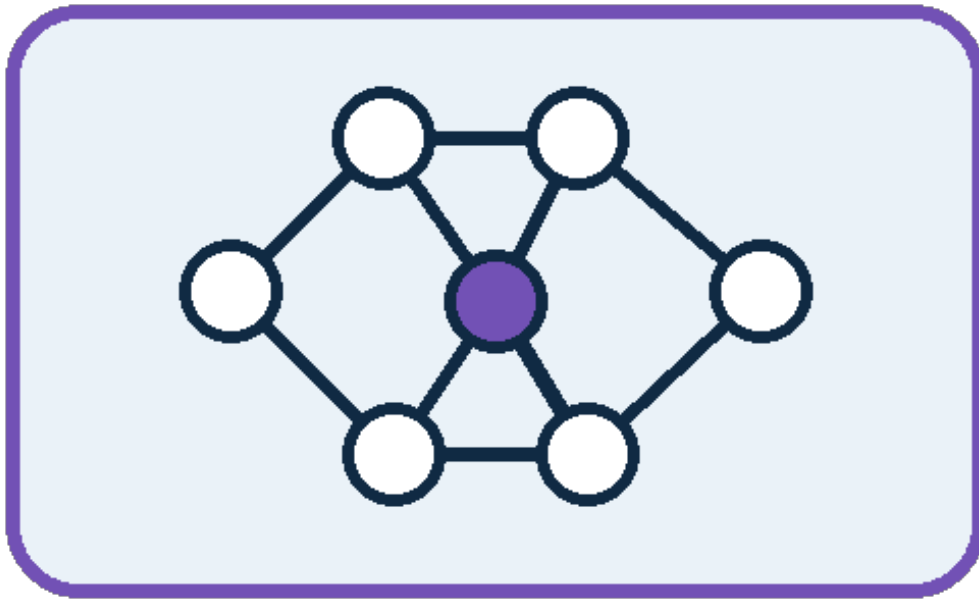

Meaning: A case where annotators assign different labels to the same example

6. Follow a worked example

WORKED EXAMPLE

Watch the Reasoning, Not Just the Answer

Every step connects a claim to observable evidence.

CASE A playground object can be both red and round, a toy and sports equipment, or safe in one situation and unsafe in another.

STEP 1 — OBSERVE objects and a purpose for sorting

STEP 2 — TRACE people define labels and assign examples

STEP 3 — CONCLUDE category names attached to items

MODEL REASONING Strong labels include a purpose and a rule for membership. Overlapping objects may need multiple labels or a priority rule. A revised definition should reduce disagreement without pretending every case is simple.

DO NOT OVERCLAIM Labels do not exist naturally in the data; people define them for a purpose.

What new evidence could change this answer?

A closer explanation

Card fields · **Relevant evidence** · **Label and reason**

Card fields: Day 12 room A

Relevant evidence: Both values satisfy the criteria

Label and reason: Ready because both checks pass

Card fields: Day 31 room A

Relevant evidence: 31 is outside 1 through 30

Label and reason: Revise because a known value fails

Card fields: Day 12 room unreadable

Relevant evidence: No known failure but the room is unknown

Label and reason: Review until the room is checked

Card fields: Day 31 room unreadable

Relevant evidence: The day already fails although the room is unknown

Label and reason: Revise because the first check has priority

For the last card, first read only what is known: day 31. Compare it with the allowed range and record a failure. The guide therefore selects revise before the missing-room check. Checking the room later could reveal another problem, but it cannot make day 31 satisfy this policy.

A clear explanation cites the particular criterion. Saying It looks wrong is not enough. Write Day 31 exceeds the accepted maximum of 30 instead. That explanation lets another person reproduce the check and challenge it if the recorded value or policy is different.

Learn from the worked case

Cover the result before checking it. Say what is given, choose the procedure, and follow one step at a time. Then uncover the result and explain your first mismatch. Ask why a step is allowed, not only what number it produces.

A pictorial worked case: Categories and Labels

A fictional craft club labels cardboard-order cards ready, review or revise.

The facts we will use

Allowed quantity: whole number 1–4. Required colour: red or blue.

If any known field fails, revise; otherwise if a required field is blank, review; otherwise ready. Cards A=(4,red), B=(5,blank), C=(2,blank).

Categories and Labels

Start with the supplied facts

Follow each arrow. Ask which fact allows the next step.

1. Read policy

Check known invalid fields before checking missing ones.

2. Card A

4 is allowed and red is allowed: ready.

3. Card B

5 is outside 1-4: revise, even though colour is missing.

4. Card C

2 is valid but colour is blank: review.

CHANGE ONE THING

Change B's quantity from 5 to 4; leave colour blank.

Explain the changed result using the matching lesson.

Read the picture one step at a time

Step · What happens and why

Step: 1. Read policy

What happens and why: Check known invalid fields before checking missing ones.

Step: 2. Card A

What happens and why: 4 is allowed and red is allowed: ready.

Step: 3. Card B

What happens and why: 5 is outside 1–4: revise, even though colour is missing.

Step: 4. Card C

What happens and why: 2 is valid but colour is blank: review.

Match each pictured step to the supplied facts. This is a worked teaching case, not an independent assessment.

Why this result follows

Operational labels specify what a word means for this task. Two labellers using the same priority should agree on these cards. Review describes missing evidence, not a hidden assumption that the card is wrong. Revise is supported by a known failure.

What this example does not establish

Agreement between labellers does not prove this policy is suitable for every school or that labels are objective truths.

Read the labelled picture: Explain why B originally was revise rather than review, then label its changed version.

Change one thing: Change B's quantity from 5 to 4; leave colour blank. Predict the result before checking the explanation. What remains the same?

7. Find and repair a mistake

COMPARE

Same Result, Different Reason

A comparison helps reveal the true concept boundary.

Case · Evidence · What it shows

Case: Red ball

Evidence: red and round

What it shows: multiple descriptive labels

Case: Frisbee

Evidence: toy or sports equipment

What it shows: purpose changes label

Case: Wet slide

Evidence: equipment and possible hazard

What it shows: context matters

Case: Mystery object

Evidence: insufficient features

What it shows: need more information

Repair two tempting claims

CLAIM A Every object has exactly one correct label.

Repair:

CLAIM B Disagreement proves one person was careless.

Repair:

STRONG ANSWER FRAME I claim _____ because the evidence shows _____. The process is _____. One limit is _____.

A closer explanation

If two annotators agree on four of six cards, we know that four assigned labels matched. We do not yet know whether those labels followed the guide. Both annotators might have made the same mistake. Check their reasoning against the criteria and, where necessary, the source record.

Even perfect agreement under our calendar policy would not prove that the room is really booked. It would only show agreement about whether the printed fields pass the specified checks. The policy itself may need changes for a real calendar. Record the policy version so examples labelled under different instructions are not mixed without review.

Two people label every card ready. Explain why their agreement alone does not establish correct labels or confirm the events

8. Practise together

GUIDED PRACTICE

Try It, Check It, Explain It

Use support now so you can succeed independently later.

Explain how the picture story demonstrates this idea: Labels are human choices that may overlap or be unclear.

Use a fresh example to explain category.

Trace a new input → process → output example.

Find and repair the error in: Disagreement proves one person was careless.

Invent one edge case and name the safe response.

PARTNER CHECK Point to the evidence. Do not accept an answer that only repeats the vocabulary word.

A closer explanation

Mina labels day 30, room B as ready; Theo labels it revise because he thought the range stopped before 30. The disagreement points to a boundary interpretation. The guide says including both endpoints, so 30 passes. The appropriate repair is to clarify and practise the inclusive boundary, not to change the label

merely because one student is more confident.

Label day 0 with room A and day 18 with a blank room. Cite the exact rule for each and explain why the two cards need different next steps

Ask annotators to label examples independently before comparing. If they copy one another, agreement no longer tells us whether the guide can be applied independently. Keep the original labels and reasons when discussing differences, then record any corrected labels separately.

Practise with less help: Replace a vague instruction

Use workbook W2 for the connected example “Categories and operational labels”. First fill the input and rule boxes. Try the middle steps before asking for a hint. After a hint, try the next step yourself.

Plan · Do · Check

Plan: What is given? Which rule or procedure applies?

Do: Record each intermediate step.

Check: Does the result follow? What remains unknown?

Explain your trace to a partner. Your partner points to one step to check. Swap roles on the next case. Each person writes their own explanation.

Check your reasoning

Use the worked case for Categories and operational labels. Proposed explanation: “A blank is the same as a failing value”. Decide whether this explanation is supported. Point to the step or supplied fact that decides; explain your repair if needed.

Answer on your own before discussion. If you are unsure, say which step you need help with.

Explain the picture

Explain why B originally was revise rather than review, then label its changed version.

My explanation using a pictured step and the given facts

This is supported practice. Keep the separately named independent case for an attempt before feedback.

9. Run the investigation

EXPLORER LAB

Playground Label Council

Predict first, test honestly, and explain what the evidence means.

State your prediction before the result is known.

Complete the task: Design labels for playground objects; challenge ambiguous cards.

Keep a normal case and an edge case clearly separated.

Record what happened—even when it does not match your prediction.

Explain the result, one limitation, and the next useful test.

Case · Prediction · Observed result · What it means

Case: Normal

Prediction: _____

Observed result: _____

What it means: _____

Case: Edge

Prediction: _____

Observed result: _____

What it means: _____

INDEPENDENCE After support is removed, repeat the proof with a fresh case.

Plan → try → check

Before trying: what do I expect, and why? While trying: which step could first go wrong? Afterwards: what did I actually observe, and what should change? Keep “not run” if you only traced the procedure.

10. Build your understanding

PRACTICE LADDER

Climb from Recall to Defense

Each step asks for a stronger kind of understanding.

RECALL Define category.

EXPLAIN Labels are human choices that may overlap or be unclear.

TRACE Show the input, process, and output.

DIAGNOSE Repair: Every object has exactly one correct label.

TRANSFER Apply the idea to a new home or classroom case.

CREATE Design one revealing test.

DEFEND Give a claim, evidence, mechanism, limit, and safe action.

RETRY RULE A coached answer becomes mastery only after you solve a different case independently.

11. Connect your project

PROJECT

Helpful Classroom Sorter

Build one coherent system across the year, one evidence-based decision at a time.

THIS WEEK'S CHECKPOINT Define the Classroom Sorter's bin labels and write how to handle objects that reasonably fit more than one bin.

What real classroom need does this serve?

What information is necessary—and what should stay private?

What happens inside the process?

What normal and edge cases will you test?

When should it say not sure or ask a person?

RESPONSIBLE DESIGN Labels do not exist naturally in the data; people define them for a purpose.

My project decision:

Evidence for your project

Write a sorter label guide with examples of complete, invalid and unresolved inputs before comparing labels.

12. Show what you know

MASTERY

Fresh-Case Independent Proof

Complete this after teaching and guided practice have ended.

INDEPENDENT PROOF

REQUIRED PROOF Create labels for six playground objects, identify two overlapping cases, and revise one label definition so another team can apply it consistently.

- ☐ Name or draw the fresh case.
- ☐ Trace input, process, and output.
- ☐ State the conclusion and strongest evidence.
- ☐ Name one limit, failure, missing clue, or fairness/privacy concern.
- ☐ Explain one safe next action or improvement.

Independent evidence:

SELF-CHECK Strong labels include a purpose and a rule for membership. Overlapping objects may need multiple labels or a priority rule. A revised definition should reduce disagreement without pretending every case is simple.

My level: ☐ Not yet ☐ With one hint ☐ Independently ☐ I can teach it

NEXT BRIDGE Carry today's evidence habit into: Features: Useful Clues.

13. Study a complete case

Week 7 Worked case

Use the supplied details to practise the weekly concept before attempting the independent question. This

case extends the illustrated lesson.

The situation

Six cards show two circles, two triangles and two squares. Sort by shape.

The question

Why can red and blue circles share a label?

Worked explanation

Both meet the circle definition. Colour does not change the agreed shape label. Apply one definition consistently.

Explain it in your own words

Which detail supports the answer, and why does it matter?

Write or draw your reasoning and evidence.

Trace the supplied case visually

Use the same label rule for every card

Evidence or stage · Value or result

Evidence or stage: Circles

Value or result: 2

Evidence or stage: Triangles

Value or result: 2

Evidence or stage: Squares

Value or result: 2

Six cards show two circles, two triangles and two squares. Sort by shape.

Why can red and blue circles share a label?

Both meet the circle definition. Colour does not change the agreed shape label. Apply one definition consistently.

14. Try a new case independently

Independent case: Transfer the method to a new record

A fictional equipment-request form accepts a whole-number borrowing duration of 1 through 7 days inclusive and one item code X or Y. Label revise if any known field fails; otherwise label review if a field is blank or unreadable; otherwise label ready. Classify these forms and justify each: 7 days X; 8 days Y; unreadable duration X; 8 days blank code. Explain whether ready alone grants permission to borrow.

My independent explanation, trace and limits

Attempt this case before feedback. Record any help. Earlier examples below are further practice; a case already practised with feedback cannot establish fresh transfer.

Week 7 Independent application

Close the worked explanation. Apply the idea to this different question without copying.

The rule is: fruit has seeds; other objects go in other. Sort an apple, a pencil and a sealed mystery box. Which item needs more evidence, and why?

My answer, with a trace, calculation or supporting evidence

Write or draw your reasoning and evidence.

Create and test

Change one relevant detail. Predict the result before testing. Include a boundary or missing-information case when it helps reveal a limit.

My changed input and expected result

Write or draw your reasoning and evidence.

Connect to your project

Define the Classroom Sorter's bin labels and write how to handle objects that reasonably fit more than one bin.

The evidence I will keep

Write or draw your reasoning and evidence.

Your teacher has the independent answer and scoring criteria. Complete the matching workbook week to keep your practice evidence together.

Transfer practice from the original programme

Your dataset labels 'reusable containers'. One team includes a disposable bottle reused once; another excludes it. Give an operational label rule and classify this boundary case under that rule. Explain why a different rule could be defensible.

Explain the mechanism, evidence and one limit.

Use feedback to improve

Attempt the independent case before hints. Record whether you worked alone, used a hint or followed a model. After feedback, fix the first unsupported step and explain why it changed. A later check uses a changed case, not a copied answer.

15. Your lesson route

Start with this question: A fictional craft club labels cardboard-order cards ready, review or revise.

By the end, I can · How I will show it

By the end, I can: Apply a category definition using explicit evidence and boundary rules

How I will show it: Explain the deciding step, show a trace or test, and state one limit.

By the end, I can: Distinguish a known failure from information that is missing or unreadable

How I will show it: Explain the deciding step, show a trace or test, and state one limit.

By the end, I can: Use disagreement to improve a labelling guide without mistaking agreement for truth

How I will show it: Explain the deciding step, show a trace or test, and state one limit.

Remember → watch and explain → try with help → investigate → try independently → keep project evidence. Your teacher may spread this lesson across several classes.

Keep your first prediction. Compare it with what the evidence shows and explain any change.

16. Finish and return

Close your notes. Explain this goal in your own words: Apply a category definition using explicit evidence and boundary rules

My deciding step, evidence and one remaining question

If you are unsure, return to the worked picture and explain one arrow. If you are ready, change an input or assumption and justify your prediction.

Save your workbook evidence. At the next review, try a different case before opening your old answer.
